California boys have made a record in judging at two great internationals. The Chicago International is touched upon elsewhere, and below is the record of California boys representing the University of California judging team, made at the International at Portland. The university announcement says: "The team made a total of 13,890 out of a possible 15,000 points, leading the nearest team, Oregon agricultural college, by 159 points. Washington State College and the University of Idaho also entered teams which placed third and fourth in the order named. H. J. van der Merwe was individual high man in all products, with H. E. Paxton a close second, both of the California team. Prof. G. D. Turnbow of the dairy industry division, University of California, coached this year's team as well as the team last fall, which won first place."

The winners are:

Milk

Wm. Waxmuth, Oregon; W. D. McClain, Idaho; A. B. Widby, Oregon.

Butter

W. T. Putnam, Washington; H. E. Paxton, California; H. J. van der Merwe, California.

Cheese

H. J. van der Merwe, H. E. Paxton, H. A. Sallis, California.

Contest

In this class, where greatest honor was obtained, it will be noted that the two highest were from the California team. H. J. van der Merwe, H. E. Paxton. Wm. Waxmuth of Oregon was third.

Agricultural News Notes of the Pacific Coast

Northern California

Effort is being made to organize a farm bureau in Lassen County.

The apple packing season in Sonoma County is practically over.

Miss Edna Black has been appointed home demonstrator in Tehama County.

A one day school in farm management will be held at Placerville, January 26, 1922.

Delegates from the National Grange Annual at Portland have been guests of the Santa Rosa Grange.

A special effort is now being made to organize home departments in the Butte County farm bureau.

Growing sentiment in favor of formation of a farm bureau exchange is reported from Shasta County.

Packing and curing of winter corn fed pork has begun at the Farmers' Exchange packing plant at El Dorado.

A two weeks' short course for beekeepers is now being given at Berkeley. The course ends December 17.

As soon as the wet weather sets in Horticultural Commissioner Stabler of Sutter County will start campaign against squirrels.

Many test plantings of purple vetch are being made by farmers of Butte County. They are also planning to try out hubam clover.

December meetings of local farm bureaus in Glenn County: Codora, 12; Orland, 14; Plaza, 16; Willows, 19; Capay, 21; Grapevine, 28.

Black grapes in the Lodi district of San Joaquin County returned to growers an average for the season of $125 per ton, Tokay strippings $72.50.

The Sutter Basin Company claims the best average rice crop per acre upon a big acreage, a little better than 35 sacks to the acre on 1506 acres.

Early Navels from northern district are running heavily to small sizes, ranging from 200's to 324's. Lack of early fall rains is held responsible.

The Pacific Coast Hereford Breeders' Association will hold its annual consignment sale at the university farm at Davis, the latter part of February.

The chamber of commerce of Anderson, Shasta County, has established a free farm employment bureau chiefly for the purpose of checking employment of Japanese.

Marston Campbell has been appointed branch manager of the Santa Rosa office and warehouse of the Sperry Flour Company. Mr. Campbell is an authority on poultry feeds.

Stockmen who have federal grazing permits in Lassen national forest will meet at Oroville some time in January to organize an association to more efficiently care for their collective interests.

The Elmira Agricultural Club of Solano County at its recent annual meeting elected Helen Thompson president, Don Hansen vice-president, Morris Daily secretary and Dorothy Schuman reporter.

A Gravenstein apple contest has been started in the Sebastopol district of Sonoma County to continue for five seasons to discover methods of securing maximum yield and to locate trees which may be used for propagating better yielding orchards.

Central California

Exeter, Tulare County, reports Emperor shipping season ended.

Don Pedro dam has now been completed to a height of 30 feet above stream bed.

Fig Brownies, the latest product of the California Peach and Fig Growers, has met instant popularity.

Visalia reports a pear tree known to be over 73 years of age still bearing commercially profitable crops.

Bankers of the San Joaquin Valley met in semi-annual convention at Lindsay, Tulare County, last week.

A new casein plant has been opened at Gustine, Merced County. This will afford increased market for skimmilk.

Paving has been completed on the Porterville-Springville highway and it will be ready for traffic December 24.

Peanut growers in the Shafter district of Kern County are threshing. They have formed a local marketing association.

Both the Sun-Maid Growers and the California Peach and Fig Growers are cutting down force employed in packing houses.

The "Land of Kerman," Fresno County, claims one-tenth of the season's total estimated raisin tonnage of 120,000 tons.

Poultrymen of Ceres, Stanislaus County, brought home a gratifying number of prizes from the Oakland poultry show.

Practically no damage to oranges from frost in Tulare County. Heavy carload shipments of Navels are going forward daily.

Vine pruning demonstrations will be given by Prof. Bioletti in Kern County at Arvin and Weed Patch, December 16; Shafter and Delano, 17.

Reedley, Fresno County, citizens held a meeting last week to discuss the proposed water and power initiative measure for the state.

During December and January Farm Adviser J. P. Benson of Fresno County will conduct vine and tree pruning demonstrations in different sections.

The Malaga plant of the California Peach and Fig Growers this season has handled over 400 tons of raisins, 450 tons of peaches and nearly 100 tons of figs.

Governor Stephens opened Valley Citrus Fair at Visalia today. Madera, Fresno, Kern, Kings and Tulare are uniting in effort to make the show a huge success.

Deputy County Horticultural Commissioner Androus of Kern is making inspection trip and a census of fruit trees and vines of the eastern portion of the county.

Tulare County will not this year mix lime-sulphur for spray and sell to growers at cost. This because of state law requiring the county as a seller of poisons to purchase state license.

The sixth annual fig institute will be held at Fresno, January 13 and 14. The dried fig contest held in connection with it will be judged by G. P. Rixford, Lester Eastin and Prof. Ralph E. Smith.

Proposal to enlarge Sequoia national park and change the name to Roosevelt national park will be brought up for hearing before the house public lands committee at Washington on December 13.

Southern California

Heavy lettuce shipments are now going out.

Cow Tester Soden of the Orange County Cow Testing Association has resigned his position.

The organization of a beet growers' department in the Orange County farm bureau is being considered by the directors.

Orange County is just cleaning up on Valencias. Several carloads of Navels are being shipped for the holiday market.

The state board of health has asked indictments against a number of Japanese for heavy spraying of celery with chemical solutions.

There is proposal that San Bernardino empty its sewage into Warm Creek to be diverted into irrigation conduits for Riverside.

Cotton growers of Blythe, Riverside County, have sent representatives to Coachella Valley to investigate possibilities of securing Acala seed.

Lettuce growers of the Imperial Valley have adopted by unanimous vote the U. S. tentative grades for head lettuce for the coming shipping season.

Members of the Santa Ana Walnut Growers' Association have received final payment on the first pool of the association. One of the features of the 1921 selling campaign is the quick cleanup.

After investigation of charges that Mexican children are discriminated against in schools of Calipatria, Imperial County, State Superintendent Wood officially denies that they have any justification.

An ordinance regulating dairies and sale of milk in Riverside County is being considered by the supervisors. This is the ordinance prepared by the state dairy bureau and already passed by several counties.

The Redlands-Highlands Fruit Exchange last year handled 2,660 carloads of citrus fruit, selling expense averaging less than 7 cents per box. L. M. Winston was chosen president and H. W. Seager manager.

Schools in farm accounting were held in Riverside County, December 5-9, at points where sufficient interest was manifested in them. They were given under university extension management, cooperating with the office of the farm adviser.

Cotton growers of the Arvin district of Kern County have sent 150 bales of long staple Egyptian cotton to mills at Prague, Czecho-Slovakia. On this shipment growers are advanced 14 cents per pound through the war finance board. The cotton was carried by trucks to San Pedro harbor.

Instruction in the computation of citrus production costs will be offered Orange County citrus growers when R. V. Wright, farm account specialist of the University of California, opens his one day class at 9:30 a. m., December 15, in the biology building of the Fullerton Union high school.

Secretary W. W. Van Pelt of the Southern California Fair Association announces a meeting of Southern California fair secretaries in Riverside at noon on December 14. There will be nine fairs of the Southland represented. The object of the meeting is to arrange dates of next year's fairs so that there will be no conflicts.

The Coast and General

The Idaho state land board has reduced grazing fees on state lands.

Membership in the United States Grain Growers has passed the 20,000 mark.

Farmers in the Salt River Valley of Arizona are plowing for wheat and seeding.

Alfalfa in the Salt River Valley of Arizona has been checked by the first heavy frosts.

Cattle growers of Grant County, Arizona, are shipping feeders to Colorado and California.

About half the olive crop of Arizona has been picked. The yield is larger than usual.

Mexico is sending a delegation to the water and power conference at Riverside, December 8-10.

Wenatchee, Washington, has shipped out over 8000 carloads of apples and has 2000 more to go.

Arizona beekepeers are selling light amber alfalfa and cotton honey at 5½ cents f.o.b.; light amber mesquite, 6¾ cents.

Continued dry weather in Northern Arizona is showing a diminished flow of springs and small streams through pasture land.

Conditions in the Fort Apache Indian reservation are reported as favorable, cattle good, range good, water sufficient.

Cotton and corn in the Salt River and Yuma Valleys of Arizona were killed by frost last week and slight damage was done to olives.

The Washington Jersey Cattle Club is carrying on an enthusiastic statewide membership campaign. "Over the top by January 1" is the slogan.

Farmers in the Hastings section of Florida who have been unable to sell sugar cane to factories are planning to grind for themselves and sell the syrup.

Shipping is over in the Pinto section of New Mexico, but large numbers of sheep and cattle have been shipped recently from Holbrook, Arizona, and vicinity.

The Oregon State Beekeepers' Association will hold a "beekeepers' roundup" at Pendleton, January 26 and 27. Disease control, inspection and cooperative marketing are under discussion.

The department of agriculture and development of Mexico is furthering the distribution of modern agricultural implements among the farmers of the country by means of commercial agencies established throughout the republic.

Eighty carloads of navel oranges were shipped from the Salt River Valley of Arizona up to the last of November, just about completing the navel harvest for the year; only about half the grapefruit has thus far been picked.

The United States bureau of markets reports: "Spray poisoning has proved a real menace in the northwestern states. Thousands of colonies were killed by feeding on alfalfa blooms in sprayed orchards, and many other colonies rendered partially unproductive. Bees not badly poisoned recuperated as a result of the late honey flow. Colonies in favorable unpoisoned district gave better crops."

Potato Growers Meet

By Ernest Braunton

AT THE annual fall session of the potato growers' department of the Los Angeles farm bureau, T. H. Lambert presiding, the opening address was made by W. S. Rosecrans, president of the bureau. His subject was "The American Farmer Is Waking Up," a strong endorsement of and plea for cooperation in all lines.

He asked all present to join the bureau, and that all could do so the annual dues were kept at the lowest figure, so far as known, of any county bureau in the country. The largest membership enjoyed was 2,000—"we should have 4,000." The legislative committee examined all bills put before the last state legislature that affected agriculture, 35 in number. Of these 20 were condemned and worked against. Not one of them passed. Of the 15 approved, 12 passed and became laws. A program was outlined for active work for the coming year, to include water conservation, flood control, land drainage, rural sanitation, and marketing. Farm bureaus are organized in 39 counties in California.

B. C. Bougher of the farm adviser's office outlined the field experiment program for the coming year. A better cover crop is needed than melilotus, for it does not grow well in cold weather. Purple vetch and Hubam will be given thorough trial. Berseem clover from the river Nile gives great promise. It thrives at a temperature of 28 degrees Fahrenheit, grows two crops of hay and then a crop for turning under. Such a cropper in this state would make it a universally used cover at once. Sulphur as a fertilizer and for scab control, the use of gypsum, fish meal and sulphate of ammonia for potatoes will be studied in plats with proper check control. The White Rose is at present the best variety, but some new varieties of unusual promise will be given trial. Several plats in various sectons will be planted to seed potatoes from Temecula and Yucaipa to test their reputed superiority. Fall crop experiments will be conducted and the yield and treatment of each plat recorded. At present our fall crop is but 50 to 60 per cent of what it should be. A potato show probably will be held some time during the year. The cost of potatoes per sack and per acre will be closely studied and determined. An attempt will be made to establish boys' and girls' potato clubs in several potato districts in the county.

Officers for 1922

A nominating committee was appointed to bring in a report submitting names for the official corps for 1922. The report as read was unanimously adopted and the following declared elected: President, E. D. McSweeny, El Monte; vice-president, W. V. Stahl, Zelzah. Executive committee: W. V. Stahl; H. L. Boyer, Van Nuys; M. H. Lambert, Owensmouth; E. D. McSweeny; J. H. Aulenbrock, Arcadia; Wm. Houghton, Norwalk; J. C. Craig, Owensmouth; T. H. Lambert, El Monte.

A resolution was adopted requesting the bureau of plant industry of the U. S. D. A. to detail special investigation of problems of Southern California growers, especially that of securing satisfactory fall stand.

In view of the seriousness of the nematode situation as it affects all field and truck crop growing, the president of the Los Angeles County farm bureau was requested to appoint a committee to undertake an educational campaign through publicity, meetings and demonstrations to acquaint the growers of Los Angeles and adjacent counties with the available information concerning the nematode and its damaging effects, this committee to meet at least once every two months and carry out a systematic campaign of education, also that this committee get in touch with presidents of the farm bureaus of the eight southern counties notifying them of this campaign and seeking their support.

A third resolution was passed suggesting the enlargement of the division of olericulture in the college of agriculture of the University of California to provide for more scientific and practical investigation work along potato lines.

Farm Adviser Hodgson next spoke on the necessity for special potato investigation work. He said potato growing was intensive farming which brought high returns per acre. Potatoes alone made Aroostook County, Maine, the third in agricultural wealth in the United States. Scientific investigation is much needed; our knowledge of the crop needs is crude and limited. For instance, in fertilization we do not know that potash is needed for potatoes, or what it does, yet we apply it. There are 200 varieties of potatoes grown in this country; the number should be materially reduced. Los Angeles County grows on a commercial scale 102 different crops. Some good agricultural states grow but one-fourth that number. We should have federal aid but we will not get it unless we ask for it. "The squeaky axle gets the grease." The potato department of the Los Angeles County farm bureau should have 300 members.

The afternoon program began with a very interesting, necessarily somewhat technical, talk on the "blackheart" of potatoes, by Dr. J. P. Bennett of the University of California. He said this trouble is a strange one, hardly a disease. It is not bacterial nor fungous nor due to mechanical injury, is not produced in the field, does not of itself spread or communicate. One potato may have it, the next may never, though favorable conditions should cause it in all potatoes alike. It is due primarily to a lack of oxygen in the interior of the potato when respiration is great, due to high temperature. On the other hand, while the conditions stated bring it about, the blackheart does not become manifest until oxygen does reach the interior. The trouble is one to be guarded against in storage, and the determining factors are oxygen supply, temperature and time of exposure to the necessary temperature. There is no danger in well ventilated storage except when above 86 degrees Fahrenheit. It may occur from freezing point up to 115 degrees, and a most elaborate set of tables was presented to show under what combinations of conditions blackheart would come. In storage a temperature of 41 gave greatest freedom from the trouble. The potatoes snown by Dr. Bennett, gathered from various sections of the state and all blackhearted, were subjected to 104 degrees for two days in an electric oven.

George P. Clements of the Los Angeles Chamber of Commerce next gave a talk, teeming with statistics, on the relation of the manufacturing interests to the disposal of the cull crop of potatoes. B. C. Bougher of the farm adviser's staff briefly described the nematodes and passed about specimens of the infested potatoes.

T. H. Lambert, El Monte, presented the best methods of growing a fall crop, from which we quote the following:

"I began growing fall potatoes about 20 years ago and watched them very closely from the time they were planted until they were harvested, as I had no other way to learn their needs. The following statements are based on that experience.

"There seem to be a good many ways and ideas of planting fall potatoes here in Southern California. While only about 25 per cent of the people get a good stand, it seems rather discouraging to grow fall potatoes, but I believe that it is really unnecessary to have a poor stand. I have found by experience that you can always get from 75 to 90 per cent stand in the fall, the same as you can in the spring. Of course there are a lot of things that are necessary to do to insure these stands. In the first place, we find it very much easier to get a stand on sandy soil than on the heavier soil. This is due to the sandy soil holding moisture better and lying close to the potato so as to keep the air away from the seed. On the heavier land there should be more precaution taken to get the land well pulverized and in a good state of cultivation; in other words, a first class seed bed, and the seed should be planted a little deeper in the heavier soil, but do not forget that in either kind of soil you must have plenty of moisture. I would say the soil should be wet not less than two feet deep, and more is better.

"In the spring it seems to be natural for potatoes to grow. They will even grow on top of the ground. Now in our fall crop let us create, as nearly as possible, the same conditions that we have in the spring. To do this we must plant our spring crop that we expect to save for fall seed very early, by the middle of February, and these potatoes will be ready to harvest by the first of June. Dig these as carefully as possible about the time the vines are turning yellow. Pile them up some place in the shade in bulk, not to exceed three feet in depth. Be sure not to bruise them. Cover them over with hay about 18 inches deep. It is unnecessary to do anything else until planting time, which is from the middle of July to the 10th of August.

"These potatoes should be cut in not less than two ounce pieces and planted just as soon as they are cut; in other words, the same day. If you should have a few sacks cut that have been left over at night, pile them together in as small a pile as possible and cover them with wet sacks. The reason is that if you cut your potatoes a day or two ahead in warm weather there seems to be a dried coat of starch which forms over the cut surface. When this piece is planted, before any moisture can go into it, this starch will have to decay, usually causing the piece to rot, whereas if the potato is planted while it is still moist on the cut surface the moisture from the soil immediately goes into it and will cause much quicker germination. This is one of the main reasons why you should have your soil very wet. If the soil has as much or more moisture than the potato, the moisture will go into the potato instead of the moisture going out of the potato into the soil. In my opinion this is what happens when green seed is planted in land that is not wet enough—the soil draws the moisture out of the potato, causing decay. These potatoes should be planted from three and a half to four and a half inches in depth after smoothing off the ridge to the surface.

"To plant these potatoes in the middle of February and have them come up it will be necessary for you to have seed that was planted as early as the 15th of July the summer before. Do not use seed potatoes that are planted the middle of August or after and then dig them in December or January and expect to plant them the middle of February and have them come up. They will not be ready to plant, really, until the first of April.

"We hear a good deal of complaint of spring crops in regard to the curly leaf. This curly leaf is due to what we have just talked about in planting the late fall grown crop for an early crop in the spring. If you plant in February or the first of March, if the spring happens to be backward and cold, the seed, not being old enough and out of the ground long enough, is not ready to germinate—what you try to do is to force germination. It is nothing more nor less than a premature germination, growing a weak, frail vine which is in most cases crinkly. We have, of course, a few other curly tops, due to inferior seed stock or what we call 'damping off' just before the sprout is out of the ground. Then another weak sprout starts out from this same sprout just below where it damped off. Ninety per cent of these will be curly tops. I have tried these same late grown seeds planted the first of May, and there would be no sign of curly top in the field."

Need for By-Products Plant

Dr. Geo. P. Clements of the Los Angeles chamber of commerce showed the necessity for saving the wastes through a by-products plant which would manufacture potato flour, starch, dextrine, alcohol, etc. He said in part:

The 1920 planting in California was 95,000 acres, 13,015,000 bushels, or three per cent of the United States crop. Actual shipments were 9,766 cars, or 4,883,000 bushels, showing a wastage of 8,132,000 bushels to California alone. Of 390,000,000 bushels in 1919 only 40 per cent reached the home (Hoover). In 1918 Los Angeles County only saved one-third of its crop; less than one-half, or 1,896 cars, were dug.

Our normal consumption is 4.50 bushels per capita. California consumes less potatoes than the rest of the United States due to our wonderful range of vegetable production, yet we consume about 12,000,000 bushels, and much of this comes from other states.

Our wastage may be divided under three heads: Field wastage is one-third in California, one-fifth in the United States; shipping and storage waste is one-fifth; culinary waste is two-fifths, according to Dr. Wiley. In all it amounts to from one-third to three-fifths of the entire crop, varying according to seasons. Our field waste in California, without the aid of the eel-worm, is enormous, some years terrific, and always senseless. No other country would tolerate these wastes.

An ordinance or ruling forbidding the sale of nematode potatoes will add to this waste unless we make some provision to care for the by-products. The by-products of the potato are chips, dehydrated potato, potato flour, starch, and dextrine. A by-product manufactory must be big enough to handle all these and other vegetables, besides an all year run, in order to pay.

What we are wasting may be summed up thus:

One ton of potatoes makes 425 pounds flour; 20,000 tons means 15,500,000 pounds at 8½ cents; total, $2,015,000. Or, one ton of potatoes makes 250 pounds starch; 20,000 tons means 5,000,000 pounds, at 5½ cents, a total of $275,000. Again, one ton of potatoes makes 250 pounds dextrine; or the 20,000 tons means 5,000,000 pounds, at 10 cents, which totals $500,000. One more: one ton of potatoes makes 16 gallons of alcohol; 20,000 tons means 320,000 gallons, which at $2 equals $640,000. California is losing this. The farmer would have saved four-fifths of his freight and the cost of sacks also by delivering in bulk at mill or factory. This would have kept a two unit mill consuming 3,000 pounds of potatoes and turning out 600 pounds of flour 1,250 days, or three and a half years. Such a mill would cost for machinery alone $35,000 and the cost of manufacturing 600 pounds of flour $9.50, about 1½ cents the pound.

Starch and dextrine mills call for more expense to operate and return less profit. Alcohol takes all waste and needs no expensive machinery or plant. Don't think you have to go outside of the county for a by-product plant. Buy one of our present plants

The Year Ahead

By T. C. Tucker, Manager California Almond Growers Exchange

CALIFORNIA almond growers face 1922 with two major battles in the perspective.

The first battle, common heritage of all farmes' cooperative organizations, is that never-ending struggle against those who would wreck every agricultural cooperative by hook or crook for their own private, speculative profits, pretending in the doing of it that they are the farmers' friends.

The second is of specific concern to the almond growing industry in the state, the fight for a 5 and 15 cent tariff schedule, duties which will give our growers a chance to compete against the peasant growers of Southern Europe. It seems probable now that we will reach the crux of our tariff struggle about next February, according to advices from Washington which state that the senate finance committee hopes to have a permanent tariff bill framed by that time.

In making their tariff fight our growers feel that they have served the cause of all farmes' cooperative associations. The intelligent farmer or orchardist has only to ask himself, "Who else would make a tariff fight for him?"

Yet it is common knowledge among officers of California cooperative organizations that farmers in all branches of organized agriculture are prone to listen to the siren offers of speculators and in many cases to desert their fellow producers for the sake of a few dollars. It seems human nature to forget the sorrows of the past and, therefore, farmer nature to forget the days when the speculator named the price of the grower's product, many times below cost. Farmers' cooperative associations broke the speculators' power to name prices, but that power can only remain broken so long as the farmer pays unfaltering allegiance to his cooperative by refusing to sell outside his pool, no matter how attractive the inducement.

There seem to be no ends to which the speculator, bent on regaining his lost power, will not go. If his "cold cash" and offer of higher price does not induce the farmer to "sell out" his clan, our speculator does not hesitate to summon calumny to his aid. He is quite willing to whisper scandal, hoping to arouse distrust in his victim's mind, distrust of the particular cooperative to which the farmer belongs, distrust of its business methods and its officers.

The speculator knows the value of rumor. He knows the span of her wings and the speed with which she travels and how savage she becomes in flight. He knows, too, that it is hard to capture her and bring her home to roost. So he whispers "you know—they say." And rumor takes flight to blacken the names of honest men.

It is a wise farmer indeed who turns a deaf ear to that sort of thing. The brand of man who mixes scandal with his business is the wrong kind of a man to deal with. He ought to be anathema to every member of an agricultural cooperative association.

Now as to tariff, our almond growers are muddling along the best they can, confident that congress will sense the justness of their plea and the imperative necessity of adequate revision of the Fordney bill to a 5 and 15 basis if almond growing in California is to thrive. Our growers have presented their facts and figures showing that the schedule they ask will give them only a fighting chance in our own American markets against the foreign grower. We can only wait the issue. Meantime public opinion throughout the state must continue to make itself felt.

Recently through the efforts of Senator Johnson a group of 16 western senators agreed to make a fight for the 5 and 15 schedule before the senate finance committee and on the floor of the senate if necessary. These senators constitute a powerful group in the senate. All of them, save Senators Johnson and Shortridge, represent states where the almond tree is unknown. It is a significant thing that the plain fairness of the California almond growers' plea enlisted the unqualified support of these senators.

Improvement of Plants

Realizing the need for improvement and higher average production in sugar cane Hawaiian planters made appeal to Mr. Shamel of the U. S. department of agriculture to investigate as to the various types of producing canes in the islands. Mr. Shamel spent several months in the Hawaiian sugar fields. He made an address before the Social Science Association of Honolulu and its members consented to publication of the address by the experiment station of the American Planters' Association. This address, "Improvement of Plants Through Bud Selection," has to do with plant improvement, definition of terms, origin of varieties from bud mutations, elimination of undesirable strains, selection of superior parent plants, progeny tests, and other phases of plant improvement. In addition to the most complete text there are over 40 full page plates.

From the text we quote:

"The overshadowing interest amongst scientists in the study of the phenomenon of sexual variations in plants and the behavior of seedlings grown from these variations during the past century has resulted in the partial neglect of the equally interesting and important field of the investigation of bud mutations and the characteristics of plants originating from them.

"As the writer sees it, the scientific problems in this connection include a study of the extent and frequency of bad mutations in all of the agricultural varieties, an investigation of the fundamental causes of the phenomenon of bud mutation, and the development of improved methods of propagation. This investigational work should precede and lay the foundation for the commercial work. While this arrangement may apparently delay the utilization of bud selection, it may, as a matter of fact, hasten the time when economic results can be obtained. The scientific studies of bad mutations, their origin and development, will probably result in the discovery of simplified methods of bud selection and insure protection from disappointments due to operations founded upon defective plans based upon incomplete knowledge leading to premature and oftentimes erroneous conclusions. In some instances it may be found feasible to carry on the investigational and commercial work simultaneously. The writer believes that such is the case in the work for the improvement of sugar cane through bud selection. As the result of an experience covering more than 20 years in both the investigational and commercial work of plant breeding the writer wishes to emphasize the necessity for scientific studies in this connection in order to discover the underlying principles of bud mutation and bud selection as a means for establishing this work in every instance upon a sound and lasting foundation."

SPRAY THE GRAPES

Of special interest to grape growers is Farmers Bulletin 1220 which may be had by request to Division of Publications, U. S. D. A., Washington, D. C. The bulletin is of 76 pages and filled with illustrations and text upon "Insect and Fungous Enemies of the Grape." Its preface says:

"The present paper treats of important insect and fungous enemies of the grape in the United States, and gives for each the methods of control at present known to be most effective. There is also given at the close of the bulletin a schedule of applications of combined insecticides and fungicides which, if carried out according to directions, will insure a high degree of protection from the various insect and fungous troubles of the grape. Commercial vineyardists, for the most part, follow some schedule of applications, though in many instances sufficient attention is not given to thor-

oughness or timeliness in treatments.

"In the case of grapes grown principally for home use, or on a small commercial scale, there is each year a large loss in the aggregate from failure of owners properly to spray their vines. The spray schedule should be especially useful to these indivduals, and if carefully followed will materially increase the quantity of fruit obtained.

"Vineyards, however, should not be sprayed so near ripening time of fruit that there will be left on the berries at harvest a noticeable amount of spray residue. Thorough applications early in the season as indicated in the schedule of treatment will obviate the necessity of later treatments with consequent discoloration of the fruit with the spray mixture.

FRUIT PRODUCTS CONVENTION IS SUCCESS

The recent Canners and Fruit Products Manufacturers convention held at the University of California was a great success, according to W. V. Cruess, associate professor of fruit products and in charge of the fruit products laboratory.

E. W. Moorhead of the California Fig Growers Association gave an interesting report on the development of new fig products. The kadota fig is used in their canning and preserving and makes an excellent product.

C. H. McCharles, assistant director of the pure food and drug laboratory of California, spoke upon the methods of determining solids in tomato products. He stated that several published tables giving the relation between tomato solids and the specific gravity are in need of revision.

The spoiling of canned foods was quite thoroughly discussed by Dr. F. K. Meyer, Dr. I. C. Hall of the University of California, and Dr. E. C. Dickson of Stanford University. The need of further work on bacillus botulinus was emphasized by all the speakers.

E. L. Overholser, assistant professor of pomology, described several varieties of pears which would fit into the canning season in California and supplement the canning of Bartlett pears. Among these he mentioned the Klapp favorite, an early ripener, and the Bosc, a late ripener.

PLANT DISEASE AND PEST CONTROL

"Plant Disease and Pest Control" is the title of a new publication just issued by the University of California. It is the work of W. T. Horne and E. O. Essig. It gives in brief form descriptions of pests and diseases most commonly found attacking and injuring plants of California and contains suggestions for their control. Formulae for preparations used to protect plants against fungi and insects are given with brief instructions for use. Technical material has been omitted and only brief descriptions and directions given. This publication, No. 277, will be sent without charge upon request to the University of California, College of Agriculture, Berkeley, California.

WALNUT GROWING IN CALIFORNIA

"Walnut Growing in California" is the title of a new bulletin, No. 332, just issued by the University of California agricultural experiment station. This bulletin is intended to answer many of the general inquiries of the walnut growers of California. It may be considered a handbook for the walnut grower.

The climatic, soil and water requirements are treated in detail and the commercial varieties of walnuts described and illustrated. There is discussion of the choice of root stocks and nursery trees, together with detailed directions for starting the young walnut orchard.

General directions are given for the control of such insect and disease pests as codling moth, aphis, red spider, melaxuma and winter injury. Directions are also given for the harvesting and curing of the crop, as well as the packing house requirements for the successful marketing of walnuts.

An estimate is given of the cost of production and the income which may be derived from walnuts in California. This bulletin may be obtained by request to College of Agriculture, Berkeley, California.

Interplants

By James G. Forsyth

TO prospective growers of orchard trees late in attaining full bearing a few pertinent facts on interplanted trees may be helpful. Much depends on the locality and available markets when deciding what kind and variety of fruits to use as interplants. If fruit trees are chosen they must have two qualifications — abundant, early bearing and small size. Size is always a factor but need not be so strongly emphasized when the permanent trees are set at 50 or 60 feet, as is sometimes the case with figs and other large trees.

Marketing the crop is fully as important as producing it. The fruit selected for the interplant must be one which will find an easy market. Where the grower is close enough to large city markets the logical fruit is one early ripening and suitable for shipping fresh. For example, any of the commercial plums or peaches. On the other hand, for more remote situations a type of fruit should be selected which is less perishable and may be canned or dried. The establishment of canneries in the outlying orchard districts provides an excellent market for the fruits which are suitable for interplanting. Occasionally a planting is made with both the permanent and temporary trees of the same variety. This arrangement is valuable when the trees are of a small sized and early bearing variety.

With judicious handling an interplanted orchard will not suffer in comparison with one not interplanted, but there is one very important factor which will indicate the advisability of interplanting, namely, the human element. The plan, when the orchard is first set out, is to remove the interplanted trees as fast as they show signs of crowding the permanent trees. But when the trees are nearing the age at which they should be pulled out it seems very difficult. Until the trees have irreparably injured each other in the struggle for existence the grower is prone to let himself believe that the trees will stand "just one more year" without great injury, and, of course, it must be admitted that they are bringing in additional revenue.

If the interplants are not removed at first signs of crowding the time will be surprisingly short before the monetary returns are no greater than the orchard would be producing if it had not been interplanted. While the actual tonnage of fruit may still be larger the fruit of the interplanted orchard will have deteriorated in both size and quality. Small, inferior fruit finds a less ready market and will add nothing to the reputation of a grower who possesses a name for producing the best.

To sum it up, the advantage of early returns offered by interplanting, valuable as it may be to a striving fruit grower, is to a greater or less degree, depending on the wisdom of the management, offset by the danger of lasting injury to the trees by being left in the ground until the interplants have dwarfed and sapped the vitality of the permanent trees, which are the reasons for the existence of the orchard.

A safer and better plan, at least for the owner who isn't actually on the ground, is intercropping with annual crops: Grain, beans, garden truck, etc., or alfalfa. Figures prepared by farm management experts prove conclusively that the costs of bringing an orchard into bearing (meaning leveling land, setting out trees, cultivation, pruning, and spraying) may be easily borne by the returns from crops grown between the trees.

There are many eloquent examples of California orchards stunted or ruined from inexpert handling of an interplant system, and it is in the hope that fewer such mistakes will occur that this article is written.

Interplanting is a good practice if the grower realizes that no matter how it tears his heart to drag out beautiful, healthy interplant trees, when the time has come their removal is the only possible way of making a success of the permanent orchard.

WALNUT GROWERS INSTITUTE ANNOUNCED

At a recent meeting of the executive committee of the walnut growers department of the Los Angeles County farm bureau plans were laid for the fifth annual walnut growers institute which will be held sometime in January. The committee which is to have this activity in charge is composed of E. G. Hotchkiss of Covina, J. S. Killian of El Monte, W. H. Howell of Walnut, Lester Cole of Whittier and Alfred Brant of Owensmouth and representatives to be appointed by the farm bureau presidents from San Bernardino, Ventura and Santa Barbara counties.

EARLY FRUIT TREES AS WINDBREAKS

In the Antelope Valley pear growing districts orchardists are planting early apricots, peaches or crabapples along roadsides and fence lines six or eight feet apart. Such early varieties, leafing out before the pears, are good windbreaks and do not unduly rob the soil.

COMPARE THE PRICE OF

REMCO TANKS

With Prices of Metal Tanks of Same Capacity and You Will Find the Remco Redwood Tank Much Cheaper. It is also Better and More Lasting.

We will ship you, immediately on receipt of order, any standard Remco tank of the dimensions or capacities shown below at the prices here listed:

Triple Heat Control
means farm power at least cost

If you want to know why the OilPull Tractor is the cheapest power for your farm, write for our new book. It tells all about Triple Heat Control—greatest advance in tractor construction in years. Solves problem of getting the power out of kerosene. Motor is never too hot—never too cold.

OILPULL TRACTOR
"The Cheapest Farm Power"

OilPull records are due largely to Triple Heat Control. At the recent National Tractor Demonstration at Fargo, N. D., OilPull fuel costs were 7% less than the average of the best six tractors and 30% less than the average among all tractors. Thus, an OilPull easily retains the fuel-economy leadership held during the past 10 years.

Investigation of many OilPulls of various ages shows an average yearly repair cost of less than half Government figures. Hundreds of OilPulls have records of 10 years or more of active service.

These low costs make the OilPull the world's cheapest farm power unit. There is a size that will increase your profits. See it at the local Rumely dealer's. Prices are right. Meantime, write for catalog and details of Triple Heat Control.

Advance-Rumely Thresher Company, Inc.
17-19 Main St., San Francisco, Calif. (H61)

The Advance-Rumely line includes kerosene tractors, steam engines, grain and rice threshers, alfalfa and clover hullers and farm trucks

This Month in the Ornamental Garden

Southern California

By Ernest Braunton

THE "dying year" should witness the living garden; the "closing year," the opening of the active graden season. Our early rains did not continue as promised and gardening operations have suffered thereby, so that with many gardens it means a new start. The first operation in all gardens, old or new, should be soil stirring, and in general the older the garden the more it is needed. Such work is never carried out too thoroughly or too deeply; it cannot be done. Nor can fertilizer be too well mixed wtih the soil.

Air is needed in the soil at all seasons and at all stages of plant growth. A heavily compacted soil is usually a "sour" or acid soil. At all depths within the root zone it needs stirring. Dig it up deeply and allow it to weather before smoothing it down. The writer believes, in the interest of economy, that a soil should never be turned up unless some fertilizer is turned down. And none should be turned down that is not soon stirred again to insure more complete incorporation with the soil, so that each operation should have a double purpose—aeration and fertilization.

Investigation discloses a lighter planting of bulbs than in November of last year, but it is now a prime time to put them in the soil. Good bulbs direct from Holland are in ample supply in local markets and the quality is generally high. Even those left in the soil from last year are unusually tardy in appearance and suggest late or December planting a part of nature's program. It is safe to plant any of the hardy class now, and if dahlias and other tubers are in the way, take them up and store in a cool, dry, dark place until late spring.

This is a time for rose planting, and the best sort to plant are dormant bare roots. These are at their best in December. Budded roses are preferable in the weaker sorts but own root plants are equally good, or better, in the strong growing varieties. No special pruning should be done now but it is best, at all times, to take out spindly or weak canes or abnormal growths, or even to thin. We must abandon the old "pruning season" ideas brought from more severe climes. The rose is an evergreen, more or less active throughout the year. Treat it as such and train it whenever training is needed. Even deciduous fruit trees are summer pruned. As a rule roses need most attention during the rainy season, particularly at the beginning and ending of the annual precipitation.

Seed sowing of all hardy annuals and perennials may be indulged in or the plants may be set out. Sweet peas sown now will give an early spring crop of flowers. Pansies are best put in now, the younger the plants the better results will be. If in bloom when reset pinch off all, even the buds, and keep off all that show for a week. The plants need all their vigor to establish a root system in their new home. Many purchase old plants, in full flower, wadded into hard balls of soil and expect them to continue flowering as before. They will never be so good again. Pansies need a loose rich soil. A wad of heavy, sticky black soil about the roots much impairs their vigor. Get small unflowered plants if possible and transplant with a little loose soil clinging to roots. Old chrysanthemum plants may be taken up and set aside in any old place. Even if left on top of soil they will not deteriorate unless they get too dry. During January they may be revived to obtain cuttings for next season's plants. Do not fertilize lawns yet; the heavy rains are to come and nearly all the nitrogen of fertilizers will be washed away as surface runoff or carried down in light soils below the grass root zone.

County Agent Jungerman of Stanislaus in his yearly report emphasizes dangerous height of water table and increasing alkali and urges lining of irrigation canals and care in use of irrigation water.

Southern Arizona

By M. E. Bemis

IT IS a pretty safe statement that there is no expenditure of time or money—or both—that adds so much in proportion to the amount expended as does the growing of flowers. Not every farm home can be beautified because there are undoubtedly some that cannot afford the time or small amount of money, but it is fortunate that such homes are few. Many, very many, farm homes, and city homes too, for that matter, could be made far more attractive at such a small cost as to be negligible, if the owners or tenants would but make the effort.

December plantings of flowers include the following: African daisy, calendula, candytuft, carnation, centaurea, clarkia, coropsis, daisy, Globe amaranth, gaillardia, hollyhock, larkspur, mignonette, nicotiana, nigella, pansy, petunia, phlox, poppy, scabiosa, stock, sweet pea.

African daisy, known also as Cape marigold, has come into much deserved popularity in Arizona. It grows about one foot high and is well adapted to sunny locations. The flowers are orange to deep yellow. Calendula or pot marigold grows about the same height as African daisy, with yellow flowers both single and double. Candytuft, the old fashioned favorite, is splendid for edging beds. There are several varieties, some rich in perfume, and a variety of colors. Carnations require a rich soil. Flowers from seed are not the equal usually of flowers from propagated plants. It is better to transplant once or twice. Centaurea is the "alias" of the bachelors button and is also known as cornflower. These are very hardy and may be grown with so little trouble that the wonder is that the waysides are not sown thickly. The blossoms are blue, white, or rose colored.

Clarkia is a plant that is native to the Far West and therefore is very much at home here. This is one of the taller growing plants like the bachelors button. It blooms freely with white, salmon or scarlet flowers. Coreopsis, or calliopsis, makes good border or bedding plant. The flowers are single, borne on long stems. The principal color is yellow, varying to a rich maroon and sometimes brown. Plants from seed sown now should have some protection, as they are tenderer than most of the flowers mentioned above. The double daisy and the Shasta daisy, in addition to the African daisy mentioned before, are hardy and may be planted for early spring flowers. Globe amaranth is one of the everlasting flowers, useful for bedding plants.

Gaillardias grow to a height of about two feet, have beautiful double blossoms of orange and crimson, that usually bloom through the summer here. Hollyhocks, the old fashioned flowers that grandmother loved, bloom here the season following planting. Larkspurs are grown easily and make a good background for some of the shorter, lower growing plants. Mignonette grows 6 to 12 inches high and is extremely hardy. Sown now it will blossom in the spring. Nicotiana grows three feet high, with slender tubular flowers. Nigella grows about one foot high, has fine foliage and peculiar flowers of blue and white. Pansies should for best results have been planted earlier, but may still be planted and with care will produce a profusion of flowers. Petunias should be sown on an even surface and the seed barely covered. The flowers come early, the colors ranging from white through rose to almost purple. Phlox are hardy and easily grown. The blossoms are rich in reds with some approaching buff and lilac. Poppies from the California to the tall growing double poppy are so easily grown that the wonder is that there are not acres where there are instead single plants. Scabiosa, sometimes called "mourning bride" and "pin cushion flower," is old fashioned, half hardy and easily grown. The flowers are borne on long stems and vary from white through crimson and blue to almost black. The plants grow about two and a half feet high. Stocks may be had in a considerable variety. They are popular in southern Arizona. They

may be had in mixed colors or pink, crimson and white. Sweet peas are being grown more and more each year. A succession of blossoms may be had almost continuously from November to July by planting the Christmas flowering early and the late varieties in succession—the late plantings in shaded places.

The flower garden requires rich soil and careful preparation. Most seeds should be planted very carefully and covered with very little earth, and that preferably fine sand or mulch. It seems hardly necessary to say that the seed bed should be made fine and well pulverized.

EAST PAYS HOMAGE TO WESTERN STANDARDIZATION!

The live interest of farsighted men in the standardization of fruits and vegetables is adequately covered in a short, pithy, article by Prof. W. J. Wright, published in an October number of the National Stockman and Farmer. Referring to the growing competition between eastern and western fruit growers, Prof. Wright says:

"The reported action of the interstate commerce commission in reducing the freight rates on apples from the Northwest has met with some objection from eastern growers. Generally speaking such objection looks like pretty small business. If western growers can raise fruit on their high priced land, ship it 4,000 miles and drive the eastern grower off the market, then something is wrong. Either the western apple is better or the packing and selling methods of the western growers are better.

"We have little sympathy for the eastern grower who complains of western competition. When we have learned to care for our fruit a little better, and above all when we have learned to grade and pack it better, so that he who buys it can tell exactly what he is getting instead of having to expect inferior, half rotten fruit in the center of the barrel, then we will have no occasion to complain of the fickle public we now accuse of buying by eye only.

"The facts are we shall always have western fruit in our eastern markets. But if we can regain the confidence of buyers in the barrel pack we need not fear serious competition from orchards on the Pacific Coast, even though freight rates are still farther reduced."

SELLING HONEY

By G. W. Bercaw

At this time of the year the uppermost question confronting beekeepers is the disposing of the season's crop. In California alone the crop to be marketed aggregates approximately 4,000,000 pounds, exact figures not yet available, this state ranking first in production, Texas coming next with nearly the same amount, though honey is produced in more or less quantity in every state in the Union. Climatic conditions have some influence in the demand for honey; in colder climates more honey is consumed than in warm climates, and our heaviest demand comes during the winter season, 50 per cent more being used and handled during colder weather.

Advertise strictly pure, edible honey, then supply it when the demand comes. Put it up in packages adapted to trade you are serving. Put up only the best, of light color, good body, good weight, it is not really necessary for it to be "water white," but a light orange color will sell just as well and as readily. Either glass or tin containers should be used, glass for small quantities, tin for larger amounts is a good rule. Do not mix comb honey in glass jars for sale. The size of the containers will depend upon the trade served. Do not advertise "strained" honey, and as far as possible discourage the use of the word "strained"; call it extracted honey.

POTATO GROWERS MEET

(Continued from Page 601.)

or buy into one. A complete by-products plant which can take care of other agricultural wastes just as appalling as that of potatoes is what you need.

Of starch factories in the United States there are 26 in Maine, 6 in Minnesota, 4 in Illinois, 4 in Iowa, 3 in Indiana, 2 in Michigan, 2 in New Jersey, 1 each in Connecticut, Florida, Kentucky, Massachusetts, Mississippi, Nebraska, New York, Ohio, and Oregon. In 1914 we had 85 starch factories—23,540,000 pounds; in 1920 we have 59 starch factories — 16,477,000 pounds.

There is no producer's waste through the by-products factory; all peelings and the little ones go to starch. Thus three-fifths of the potato crop is saved to the grower; also the general public from shipping and storage waste and culinary waste. Have you any idea of this latter? It is estimated at one-third of the actual year's crop.

And again, if No. 1 potatoes are eelworm proof, all the danger is eliminated. The by-products plant does for the nematode.

FIGHT REPEAL OF EXCESS PROFITS TAX

The National Board of Farm Organizations is making an exceptionally strong fight against the efforts to repeal the excess profits tax. At a meeting of directors recently held in Washington a committee was appointed to go immediately to the senate with an appeal that the senate should not repeal the excess profits tax, reduce the surtaxes or by other means, such as "by the proposed sales tax, shift the burdens of taxation from those best able to pay to those least able to pay." A basis for future action has been properly laid in case the present congress shall decide upon the unwise step of shifting the burdens of taxation from quarters that can afford to pay it to those that cannot.

The board also adopted the plan of taking steps to counteract the harmful effects of a certain kind of publicity which has been stating that the congressional departmental reorganization committee would most likely recommend limiting the jurisdiction of the department of agriculture solely to production matters and might also either suggest the abolition of the federal trade commission or else place it within the jurisdiction of some cabinet officer where its independence and effectiveness would be destroyed.

APHYCUS IN TEHAMA OLIVE GROVES

The excellent results that followed the introduction of the South African parasite, Aphycus Lounsburyi, into the black scale infested citrus groves of Southern California, reducing the annual fumigation expense from $46,000 to $25,000 in a single season, has suggested the liberation of some 10,000 live specimens in the olive orchards of Tehama County. It is hoped they will have as beneficial results on the black scale on olives.

SPRAY NOW FOR PEACH BLIGHT

Special attention is being called to the necessity of spraying at this season for the control of peach blight which frequently destroys many twigs and buds in peach and apricot orchards. In the spring this fungus also works on the leaves and the fruit of the apricot, rendering the latter undesirable for the market. It is of value to note that the only practical chance of controlling this disease, which may not show up much until next spring, is to spray the trees thoroughly within the next two weeks before the disease enters the tissue of the twigs. Winter strength of Bordeaux mixture (copper sulphate and lime) is recommended for this spray.

Members of the San Diego County farm bureau are discussing opening public markets in San Diego and other centers; also retail meat markets.

KIRKMAN NURSERIES

Established in California in 1888

RELIABLE TREES AND VINES

are essential to the great fruit industries of the Pacific Coast.

Our experience has been gained by 32 years of progression in the nursery and orchard business in California.

Reservations are now being made for future deliveries.

We offer our services in undertaking the planting and care of commercial orchards on large scale.

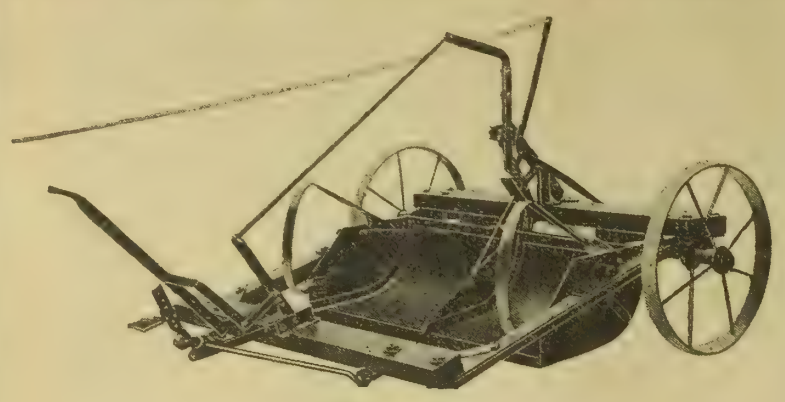
The Miskin Tractor Scraper



THIS IS IT

THE MISKIN TRACTOR SCRAPER IS GUARANTEED TO MOVE TWICE AS MUCH DIRT AS ANY OTHER SCRAPER ON THE MARKET, WITH THE SAME HORSE POWER IN THE SAME LENGTH OF TIME.

The tractor carries the front, the scraper wheels carry the balance of the scraper, loaded or empty.

Easy to fill with the lever at the side of tractor driver's seat and easy to dump and spread with the rope. No stopping nor backing up.

Made in four sizes, from one-half to one and one-fourth yard capacity. Most small tractors handle the yard size easily.

Sold with the same GUARANTEE of satisfaction or money refunded, that we have always given with our horse drawn scrapers, for which we claim 100 per cent satisfaction.

Prices, terms and capacities the same as that of the horse drawn scraper of the same number.

For $10.00 extra we can furnish attachments that will enable the owner to use them with either Tractor or horses.

Ask about our horse drawn scrapers if interested.

Write for circulars with lowered prices, and names and location of dealers.

Questions and Answers

Questions to be answered in this department should be received at the office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Bitter Milk

We have a cow which has had second calf, been fresh three months. For the past three weeks the milk, though very sweet and good while fresh, is very bitter when about 12 hours old and has an awful taste at 24 hours. Had been feeding alfalfa hay and dairy feed, but since the milk got so bitter have fed different combinations of oat hay, bean straw and alfalfa, and bran in place of the dairy feed. With first calf and first two months of second had no sign of this bitter milk. Also has an indescribable rancid after taste even at 12 hours. Corral, vessels, milk closet all are clean. Can you give cause and remedy?—Subscriber, Santa Paula.

This trouble is common at this period of the year. It is probably not the fault of the cow or the feed but may be corrected by thorough sterilization of all utensils with which the milk comes in contact. First, thoroughly wash with warm soap suds, being sure to reach every portion of the utensil outside and in. Then boil lime water in the utensil for a short time. When setting the milk protect so far as possible from dust or any other contamination.

Foul Milk

What is wrong with our cow? The milk smells foul and gets worse the longer it stands. The cow seems to be in fine condition, looks well and eats well. We have been feeding Suremilk, bean straw and pumpkins. The milk is rich in fat and the cream is even stronger than the milk. Since the milk is sometimes good when first milked and gets bad on standing, we thought that it might be the containers. But we take special pains to sterilize them thoroughly each time and yet the milk gets no better. We do not expect the cow to be fresh for two months yet.—Subscriber, Carpinteria.

See "Bitter Milk" above and in addition note temperature at which milk is kept. It is often thought that milk can hardly be kept at too low a temperature, but the development of healthful, acid-forming bacteria must be encouraged, or other bacteria proceed to grow and flourish, and ropy or foul smelling or other milk conditions are created which make for anything but an edible product. To prevent this some go so far as to boil or hold milk at a temperature of 140 degrees for, say, 20 minutes, which destroys the bacteria which revel in exceptionally low temperature. The best temperature for development of acid forming bacteria is around 59 degrees. Try the thermometer on the milk and in addition fill all utensils with boiling lime water and hold at boiling point for several minutes.

Pruning Young Trees

We have some fruit trees, peaches, figs, apricots and plums, one and two years old, and we would like to know best time to prune and if there is any special way of doing it.—Subscriber, San Gabriel.

Several volumes would not be sufficient to give all the details of the various systems of pruning. The one more commonly followed today is the long pruning system taught by Dr. Whitten of the state university. This has been touched upon in several articles in former Cultivators. Some of the recent articles are in the issues of January 22, June 11, and November 19, 1921.

Pumpkins and Squash for Feed

We have a supply of pumpkins and crookneck squash and would like to know if they could be fed to milk cows. —Subscriber, Lathrop.

Pumpkins are valuable additions to the ration for the milk cow, although their nutrient content is low. Regarding crookneck squash we have no analysis but imagine its value would be somewhat less than that of pumpkins. However, would surely utilize such a feed.

Selling Bulk Olives

Is it lawful to sell pickled olives in bulk (kegs)? I have been told it wasn't necessary to cook them unless they were canned.—Subscriber, Corning.

The ruling of the state board of health has been that only olives which have been subjected to a temperature of 240 degrees for 40 minutes may be sold in California. There are, however, tons of ordinary cured olives offered and sold both by producers and grocers. The packers are, however, calling upon the board of health to either rescind the ruling or enforce it and confiscate the olives now being offered which have never been subjected to more than ordinary temperature, or, in other words, the olive as ordinarily cured on the farm in the bath of lye followed by rinsing and later by the regular brine. If the board does take action then confiscation of the olives and possibly imposing of fines may result. This, of course, is providing the ruling of the board will "stick." So far as known there has never been a case of poisoning from eating olives as ordinarily cured and left exposed to the air. The botulinus germ is destroyed by the atmosphere though the board of health has stated, "It is possible that the germ might exist in olives cured and left in open barrels."

Spraying Trees

We have an orchard of 100 trees three years old, all different kinds of fruit, also different kinds of grape plants two and three years old. Can all the trees be sprayed with lime sulphur 1-10 strength when dormant, including cherry trees, orange trees and English walnuts? The trees were not diseased last year, except that there was a little curl leaf on the peach tree and lice on the plum leaves. Should the grapes be sprayed too when dormant this winter? They never had any disease. I intend to spray with lime-sulphur 1-10 or 1-15 strength before December 15 on peach trees to prevent blight, although they had no blight last year.—Subscriber, Lincoln.

The procedure outlined is doubtless desirable excepting as to spraying the orange tree with the lime-sulphur of the strength mentioned. Lime-sulphur on oranges or other evergreen trees or deciduous trees in leaf should not be of a strength greater than 1-33. After the leaves have dropped from deciduous trees the 1-10, or even the 1-9, strength is desirable. The peach trees should be sprayed as suggested before December 15. Then to prevent the curl another spray with the lime-sulphur 1-10, or possibly preferably Bordeaux 5-5-50, this just before buds swell in spring.

Home Storage for Apples

Mrs. Joe Scheiber of Lincoln, Placer County, sends the following in answer to former inquiry in the Cultivator as to method of keeping apples through the winter:

Take fresh sound apples, not bruised nor wormy. Put them in layers in large boxes so they will not touch each other, putting clean, dry sand in box and around the apples. Set in cool, dry place in cellar. I have kept apples in this way from October to the next July.

Unsterilized Olives

Under existing laws will I be allowed to give to the Christmas cheer of the Camp Kearny boys a quantity of olives fresh from the pickle, cold lye method of processing?—Interested, Fallbrook.

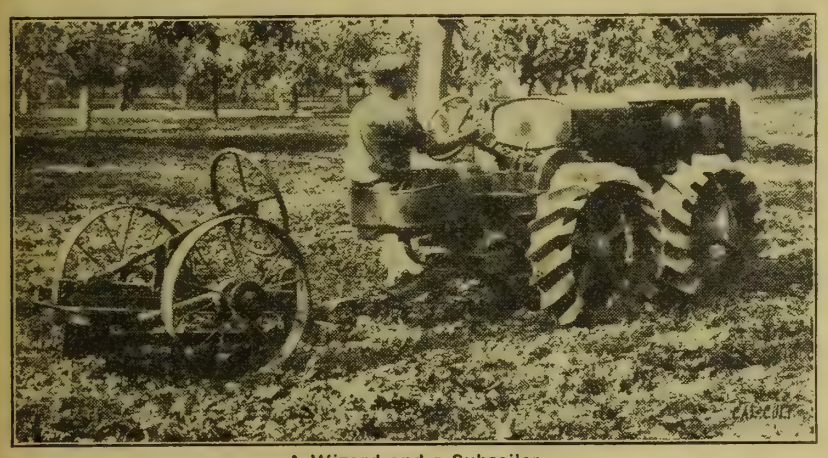
We don't know. At one time the health board made a ruling that every olive offered for sale should be sterilized at 240 degrees for 40 minutes. This regulation is not being enforced, for peddlers are continually selling from house to house and many groceries are offering to the trade. So far as known there has never been a case of poisoning from these home processed olives kept in barrels in the open and never at any other temperature than that of the water in which the lye or salt was dissolved. The ruling has worked great injustice to olive growers who have feared to process while it was standing. Appeal is being made to the health board to

rescind or enforce. In matter of sterilization, however, we may add that the steam pressure cooker or sterilizer for home canning has been made so cheap and practical that if it proves to be necessary growers can do their own sterilizing. We believe these may be had from $20 to $50, which are very satisfactory.

Carolina Strawberries

Is the Carolina a large strawberry? Is it medium mild or is it tart? How late does it produce, in other words, is it an all season berry? Will it thrive on other than sandy soil? Is it a strong grower? Is a strawberry vine that is a single cropper, bringing three or four baskets at once, profitable? How many baskets is a good average vine supposed to produce in a season?—Subscriber, Newman.

The Carolina is a large berry, mild in flavor, is a long season cropper, appears to thrive in all soils as well as other standard varieties. A variety that is a "single cropper" would be valued according to season of cropping. Ordinarily it would not be profitable but if producing at a season when berries are scarce it should be. We have no data as to performance of individual vines. In the Carolinas the record of the berry of that name on good soil is about 5,000 quarts an acre. This would be about 7,500 boxes such as are used in California.



A Wizard and a Subsoiler
Wizard tractor pulling Killefer subsoiler 21 inches in walnut orchard of Chas. S. Sanderson, Whittier.

Vegetables Under Lath

Can vegetables be successfully raised in and under lath houses where the nights are cold and hardly five months in the year frostless? What rules and design govern construction of lath houses in Southern California?—Subscriber, San Jacinto.

Such vegetables as grow in the open fields of the Los Angeles section during the colder months would grow under conditions such as you describe, but as they need all available sunshine for best development and lath houses are expensive, we would not advise such procedure if produce is to be marketed. No special rules are observed in construction of lath houses except the laths are generally placed their width, or 1½ inches apart. A few space them but an inch apart. Protection against frost is greater, but sunshine is reduced. A firm at Sierra Madre has a double roof, four inches between the two, but it is an experiment and designed for Kentia palms, which thrive best in partial shade. Various shapes of roofs have been tried but the more common and most economic of labor and material is the flat or level one.

Feed for Milk Cow

Can you please tell me if there is any truth in the idea that pumpkin seeds are bad for milk cows and chickens, drying up the former and swelling the crops of the latter? Does barley hay tend to dry up milk cows? Which would be the better additional feed for milk cows fed alfalfa hay and running on alfalfa pasturage, cotton seed cake or bran? — Subscriber, Arizona.

Pumpkin seeds are valuable. At least Henry and Morrison say: "The tradition among farmers that pumpkin seeds increase the kidney excretions, tend to dry up cows, and hence should be removed before feeding, has no good foundation. The seeds contain much nutriment and should not be wasted. Pigs relish them, and they act as a vermifuge, freeing the animals of worms and putting the digestive organs in good condition. As the seeds are rich in protein and oil, eating an excess may cause digestive disturbance. Squashes and melons, especially pie melons, or citrons, are sometimes fed to stock." Barley hay may be considered an excellent addition to the ration of the milk cow, but it must be borne in mind that it is deficient in protein and should be supplemented by alfalfa, bran, cottonseed meal or other protein containing feed. The authority above quoted says: "Barley is fed to dairy cows to a considerable extent in Europe and has a reputation for producing milk and butter of excellent quality. The Danes regard ground barley and oats as one of the best concentrate mixtures for dairy cows." The protein content in the barley hay is similar to that in the grain. The barley feed with the pumpkins would give sufficient protein though the succulent pumpkins would made a valuable addition to a ration largely composed of barley. If the alfalfa pasture is rich enough it would doubtless supply sufficient protein. A cow fed alfalfa or one on good alfalfa pasture should not need either cottonseed meal or bran.

Weaning Calf

Kindly advise me how to wean a calf three months old and how to feed it.—Subscriber, Bridgeville.

If calf is receiving skim milk and hay reduce the amount of milk gradually until no milk is fed, and substitute the following grain mixture, feeding two pounds to three pounds daily to a well grown out three months old calf: 3 parts corn meal, 3 parts rolled barley, 3 parts wheat bran, 1 part linseed meal. Keep a good quality of alfalfa hay before calf at all times. If the calf is to be used as a breeding animal it will pay to carry it up to the sixth month on at least a half ration of milk.—R. A. C.

Feed for Milk Production

I will appreciate some suggestions as a dairyman. Why are my cows decreasing in their production of both milk and butterfat? Am feeding 30 pounds dry alfalfa, 4 pounds dried beet pulp, 2 pounds bran, 2 pounds ground barley, 1 pound coconut meal. I mix the concentrates, adding about a pound of salt for the entire 18 cows, then enough water to thoroughly moisten. This feed I soak in redwood box.—Subscriber, Artesia.

Your ration is fairly well balanced for a dairy cow. Many other causes may enter into your decreasing production. You do not state the length of time your cows have been milking, whether they have pasture or other succulent feed, or under what conditions they are housed. We would not "soak" the entire grain mixture. The beet pulp may be "soaked" and the grain mixture added at feeding time. Your cows are eating rather more than the average amount of dry alfalfa hay, 20 pounds daily per cow being about the average. Change your ration by feeding three pounds of bran instead of two and add one pound of cottonseed meal. Try feeding one pound of your concentrates to about four pounds of milk produced. If possible, feed succulent feed in some form; green alfalfa, corn fodder or silage are best.—R. A. C.

50 Miles for a Dollar

For those rush trips to the railroad station or creamery—or when your neighbor wants you to come over and lend a hand—or when you've got to get to the far end of the farm in a hurry—a Harley-Davidson will get you there quicker and cheaper than any other way.

Fifty miles for a dollar—including gasoline, oil, tires and everything. Compare that with the cost of automobiling, horseflesh, or shoe leather, and you'll see why a Harley-Davidson pays for itself the first year.

Save your automobile for family use—ride your Harley-Davidson on business errands. It's easy to handle—comfortable—wonderfully durable—and no roads can stop it. You'll use your Harley-Davidson and sidecar every day—and wonder how you ever got along without it.

Let us show you how a Harley-Davidson saves you money. Write for free illustrated literature. And ask your dealer for new reduced prices and demonstration.

Attractive dealer proposition for unassigned territory. If interested, address Desk A-2.

Household Department

The Secret

God sometimes shuts the door and shuts us in,
That He may speak, perchance through grief or pain,
And softly, heart to heart, above the din
May tell some precious thought to us again.

God sometimes shuts the door and keeps us still
That so our feverish haste or deep unrest
Beneath His gentle touch may quiet till
He whispers what our weary hearts love best.

God sometimes shuts the door, and though shut in,
If 'tis His hand shall we not wait and see?
If worry lies without, and toil and sin,
God's Word may wait within for you and me.—Author Unknown.

EASILY MADE CHRISTMAS CANDIES

By Annette Squire

ARE you going to make Christmas candies this year? For the delight of giving something "a little bit different," for added gaiety on the Christmas table, or for the kiddies' stomachs' sake? Certainly home made candy is safer for the children, and you can make the delicious, wholesome gelatin candies to look as gay as any store candy, and shining fudge and puffy marshmallows to look as appetizing. The gelatin candies are the most easily made, requiring no skill, and have the advantage of keeping fresh longer. You may make them even two weeks before Christmas. The outside will harden, but the center will remain soft. They are really not at their best until they are several days old. If you have saved any ordinary candy boxes, cover the candy maker's name with a Christmas card, pasted on, and you have a Christmas box. For the Christmas tree or for favors for the table the farmer's wife can make good looking bags from butter paper and tie them like a Christmas package with red or green baby ribbon, wool or twine. Fold the sheet and stitch it into a bag on the sewing machine—if you use red thread they'll be gayer—fill only two-thirds full, turn over the top flat and tie with your gay colors.

Ordinary cake coloring can be used to tint the pastille candies, or the tablet of coloring that comes with the gelatin. If you have no green coloring, but have spinach, crush out some juice with a potato masher and use that. Children like especially the Raisin-Nut-Jels.

Raisin-Nut-Jels

Soften two tablespoons gelatin in one-half cup cold water and add juice of one lemon, juice and grated rind of one orange. Heat one cup sugar in one-half cup water, and when it boils add the gelatin and juices. Boil ten minutes, add cup raisins and boil ten minutes more, stirring. Take from the fire and add one cup nut meats and pour into a shallow greased pan; square, if you have a square pan. Stand over night, cut in squares and roll in powdered sugar.

Apricot-Jels

Make like the Raisin-Nut-Jels, only substitute for the raisins ground dried apricots. Use or omit the nuts.

Pastilles

For these cook your syrup for the three kinds all together, then pour in three bowls. For the syrup use three tablespoons gelatin soaked for five minutes in three-fourths cup cold water. Dissolve this with one cup boiling water, add three cups sugar and boil 15 minutes. Pour in three bowls. To one add grated rind of one orange and three tablespoons juice. To the second add three tablespoons lemon juice and pink or lavender coloring. To the third add green color and peppermint flavor. Pour an inch deep in shallow pans which have been dipped in cold water. Next morning cut in squares and roll in powdered sugar. If the candy does not leave the pan well, put under the pan a dish cloth wrung out of hot water.

These candies are effective topping a cold dessert or pressed into the cake icing for decoration.

Angel Marshmallows

Put one tablespoon gelatin to soak in four tablespoons cold water. Boil one cup sugar and one-half cup water till it spins a thread when tipped from a spoon. Take from fire, add gelatin, cool a little; and then beat fast with a good double wheel egg beater till the candy is thick and creamy. If your beating is slow the delicate sponginess is lost and the candy will be tough. When thick and creamy add one teaspoon vanilla, pinch of salt, and pour to depth of one inch into buttered pans. Stand over night, cut in cubes with knife dipped in powdered sugar, and roll in powdered sugar. These are plain marshmallows. To make angel marshmallows sprinkle with coconut and ground walnuts before setting away for the night and roll in coconut or ground nuts when you cut the cubes.

Cocoa Fudge (without syrup)

To make good fudge you need only to know when to take it off the fire and how long to beat it before pouring into the buttered pan. When your fudge has boiled four minutes, begin to test it; put a quarter of a spoonful in a cup of cold water, try to pick it up in a ball, and if it will roll about in your fingers and keep pliable like putty yet hold together in "a soft ball" it is ready to take off the fire. Now tip your kettle and beat it until it is cooled enough to begin to feel heavier to your spoon and to look grainy. It is at this moment that you must quickly add the walnuts or raisins and hurriedly pour out into the buttered pan. If you are too slow in pouring it out at the proper moment of thickening and graining your candy will be as good to the taste perhaps, but you will have lost the chance for the smooth, shining surface of fudge that is just right.

Boil together two cups sugar, two-thirds cup milk, two heaping teaspoons cocoa and butter the size of a walnut. Just before pouring into the buttered pan, add one cup chopped walnuts or one-half cup walnuts and one-half cup raisins. In measuring your butter, make it the size of a small walnut, for too much butter can spoil fudge. Cut in squares.

Cocoa Fudge (with syrup)

Boil together four cups sugar, two cups syrup, one cup milk, four level tablespoons butter and two tablespoons cocoa, until a little will form a soft ball in cold water. Remove from the fire and beat until it is turning like heavy cream and beginning to grain. Add two cups broken walnuts and pour quickly into buttered pans. As soon as cool enough cut in squares.

Peanut Butter Fudge

Boil together one-half cup peanut-butter, one-half cup milk, two and one-half cups sugar and one-half of a level tablespoon butter. When it forms a soft ball beat till creamy and turning heavy, and pour in buttered pans. As soon as cool enough cut in squares.

Raisin and Peanut Fudge

Two cups sugar, one cup milk, two heaping tablespoons peanut butter. Cook and beat as for any fudge, and add one cup seedless raisins just before pouring into the buttered pan.

Old-Fashioned Butterscotch

Boil without stirring until it hardens when dropped in cold water 2 cups sugar, 2 tablespoons water and butter the size of an egg. Pour into shallow buttered pan and cut in squares.

HOUSEHOLD QUERIES

Almond Paste

In further answer to request for directions for making almond paste at home we have the following from T. C. Tucker, manager of the California Almond Growers' Exchange:

"We do not have available a recipe for making almond paste in small quantities. Almond paste is made commercially by formulas that are considered more or less secret. In any event almond paste can be purchased in small tins at a much lower price than a consumer could afford to make the home-made article. Finely ground almonds will keep indefinitely, but

almond paste is not ground almonds alone, but the nuts are blanched, then pulverized, sugar is added and a certain amount of flavoring either with bitter almonds or apricot kernels."

Head Cheese and Liver Sausage

Please print in the household department recipe for head cheese and liver sausage.—Subscriber, Santa Rosa.

The head is generally used for making head cheese, but odds and ends also can be used. The head should be shaved clean, the snout skinned and nostrils cut off just in front of the eyes. Cut out the eyes and the ear drums. The fattest part of the head is generally used for lard. When the head is cleaned soak it in water for some time to extract the blood and dirt. After the head is thoroughly cleaned cover it with water and boil until the meat separates from the bones. Tongues and hearts may be cooked with the head. When this is thoroughly cooked take out the meat, saving the liquor for future use. Chop the meat up finely. Season with 1½ pounds salt, 3 ounces black pepper, 4 ounces allspice, and 4 ounces ground cloves, together with 2 gallons of the liquor for every 50 pounds of meat. This should all be mixed thoroughly so that proper seasoning is secured. If casings can be obtained, stuff the mixture into large beef casings. A hog stomach, after it is thoroughly cleaned, can be used. If the meat is stuffed into casings it should be boiled again in the same liquor in which the meat was previously boiled. The meat in the casings should be boiled until it floats on the top, then placed in cold water for a short time. Store it away in a clean, cool place on a shelf or table. Place a board over the meat in the casings with a weight on top in order to hold the shape and to prevent the moisture from collecting in one spot. If there are no casings available in which to stuff the meat it can be kept in shallow pans.

Liver Sausage

All the odds and ends resulting from cutting up the hog carcass can be used in making liver sausage. The head, if used, should be cleaned as previously described under "head cheese." The jowl may be cut off and salted down. The head, liver cut into slices, and some beef or veal, if any is at hand, should all be put into a kettle and boiled. The skin cut from the fat can also be boiled with this meat. The skin will be cooked before the meat, so it should be put into a cloth sack and removed when thoroughly cooked. Livers also cook in a very short time, and should be removed. The meat should cook until it falls from the bones. All the meat should be ground, using the small grinder plate. Add 1½ pounds salt, 3 ounces sweet marjoram, 1 ounce allspice, 1 ounce black pepper, and about 1 gallon soup (the broth the meat was cooked in). Garlic or onions can be added if desired. This recipe is for every 40 pounds of meat. The seasoning should be worked into the meat. This finished product can be put into jars covered with paraffin or stuffed into beef rounds. When stuffed into casings it should be cooked in the same water the meat was cooked in until the sausage floats. Then place in cold water until the sausage is thoroughly cooled.

Apple Stain

Please tell me how to remove the stain caused from the juice of raw apples in white lawn goods.—Subscriber, Riverdale.

Stretch stained material over deep bowl or pan, holding in place by string or elastic band around rim of vessel, and pour boiling water upon it from teakettle held at height of three or four feet so the water strikes stain with force. Continue, alternating with gentle rubbing if lawn is not too delicate, until stain disappears. Frequently if slight discoloration remains it will be bleached by hanging wet material in strong sunshine.

Canning Chickens

Would like to get a recipe for canning chickens, so am asking the Cultivator household department for help. —Subscriber, Winnemucca, Nevada.

Boil in slightly salted water till meat is tender. Strip meat from bones and pack into jars wtih a highly seasonde tomato or other sauce. The addition of the sauce not only flavors the meat but facilitates penetration of heat. Several ripe olives added to each jar will improve the flavor. Sterilize in pressure cooker at 250 degrees, 1 pound cans, 55 minutes; 2 pound cans, 65 minutes. If pressure cooker is not available sterilize in boiling water in ordinary hot water sterilizer (wash boiler, large kettle) for at least one hour three times at intervals of 24 hours. First day place filled jars in boiler with covers loosely fastened. After one hour's boiling seal tight. On following day repeat boiling without loosening tops. Repeat third day and invert jars while cooling. Time of heating should be counted after water is boiling vigorously.

We give also directions for roasted chicken and jellied chicken canned in pressure cooker. If ordinary wash boiler sterilizer is used follow directions given above.

Roasted Chicken — Draw, singe, clean and truss the chickens. Clean the giblets, place in kettle, cover with cold water, bring to a boil and simmer while chickens are roasting. For each chicken put two thin slices of bacon and place chicken thereon; if to be canned, in halves split lengthwise, or in quarters (breasts), cut before roasting. Cover the bottom of pans with water in which salt has been dissolved (½ pound for 50 pounds of chicken), and put pans in oven and cook one to one and a half hours; when done, take chickens and bacon out of pan and make sauce. To each pint of grease add 1 pound butter and 1 pint flour, mix smoothly and add 2 gallons water in which giblets were cooked, put on fire and stir constantly until it boils; chop the giblets fine and mix them in the gravy with ¾ pound salt, 1½ ounces ground white pepper and enough caramel to make a brown color. Place chicken in can and fill can one-third full of the sauce; process at 250 degrees: ¼ chicken size, 55 minutes; ½ chicken size, 65 minutes; whole chicken size, 80 minutes.

Chicken Jelly—50 pounds chicken, 1½ pounds onions, chopped, ½ ounce bay leaves, ½ ounce whole mace, 1½ pounds salt, 6 ounces gelatine. Draw and clean the chickens, cut each in 11 pieces, place in kettle and cover with meat jelly, adding the salt and onions and spices in a bag; bring to a boil and simmer until tender; remove the chicken and carefully skin and bone; add the gelatine which has been soaked in cold water for an hour, to the liquor in the kettle and stir until dissolved, then strain; if the liquid is not clear, clarify with white of egg. Place the chicken in cans, cover with the liquid. Process at 250 degrees: 1 pound cans, 55 minutes; 2 pound cans, 65 minutes.

THE USEFUL LEMON

A teaspoon of lemon juice added to boiling rice or sago will make the kernels whiter and give them a more delicate flavor.

Tough meat is made less tough by adding a teaspoon of lemon juice to the water in which the meat is boiled.

Use slices of lemon to garnish fish and game of all descriptions.

Lemon juice with olive oil instead of vinegar is preferred by many for salad dressings.

After the pulp has been removed the skins of lemons may be used as receptacles for serving salads or lemon rice.

Lemonade should be made the national drink and is greatly improved when the well beaten white of an egg is added.

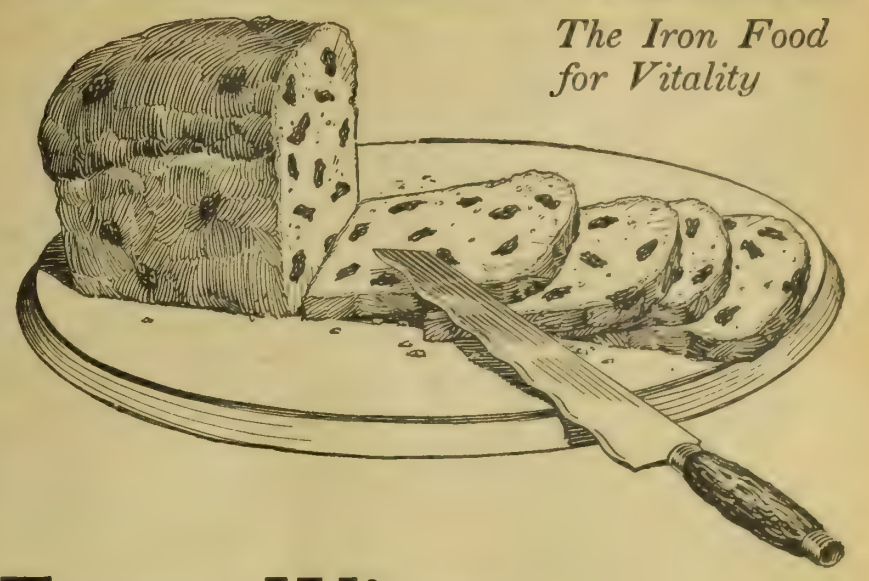
Iced tea is improved in flavor and made less constipating by the use of lemons.

After the juice has been extracted, the rind dipped in salt will clean tarnished brass.

Salt and lemon juice will remove rust, ink or fruit stains from white goods.

If you are not able to give as many or as pretty gifts this year as last, do not let that cast a shadow over you. Just add a bit more of love to it.

Christmas! The day we all go home —in thought and spirit, if it is impossible to actually go in the flesh.



The Iron Food for Vitality

Farm Wives Save Two Ways

TRY this for the next two weeks:—Let every other loaf of bread you bake be *raisin* bread. Note how your men take to raisin bread. Note that they eat *more* bread and less of the more expensive foods. You'll save more expensive foods and save left-over bread.

The Christms Pudding made with "Christmas Bread"

And Note This Too

See also how you can use the left-over raisin bread—when there is any—in delicious raisin-bread pudding.

No matter if your men have frowned on bread pudding. This is raisin-bread pudding! The luscious fruit-meats make it a *new dish* with new appetite appeal. Use plain bread in the same way—simply add the raisins when you make the pudding.

Do this and you'll have no further waste of left-over bread.

Raisins add nutrition as well as flavor to scores of foods — 1,560 calories of energizing nutriment per pound. So they're ideal food for men who work hard all day.

Bread Pudding

¾ cup Sun-Ma'd seeded raisins, 2 eggs, ½ teaspoon salt, butter size of an egg, ½ cup sugar, cinnamon to taste, ½ large loaf stale bread, 2 bananas or apples.

Soak the stale bread over night in water. When time to make the pudding press as much water as possible from the bread so the bread is about the same consistency as dough, then take a fork and get all lumps out. Do not leave the crust if it cannot be mashed to the same consistency as the bread. Add well beaten eggs, salt and stir. Add raisins mixed with the butter. Put into dish in layers, covering each layer with sliced bananas, sugar and cinnamon. Bake in slow oven until brown. Serve wtih whipped cream.

SUN-MAID RAISINS

Sun-Maid Raisins are made from California's choicest table grapes. Cured in the sun. Packed in sanitary packages in a great, glass-walled, sun-lighted plant.

They are clean, sweet, wholesome American raisins—the kind you know are good. All dealers sell them. Insist on Sun-Maid brand.

Three varieties: Sun-Maid Seeded (*seeds removed*); Sun-Maid Seedless (*grown without seeds*); Sun-Maid Clusters (*on the stem*).

Raisins are 30% cheaper than formerly —see that you get plenty in your foods.

Big Recipe Book FREE

We've put our "hundred best recipes" into a valuable book that every farm wife should have. They make nutritious foods, for raisins furnish 1,560 calories of energizing nutriment per pound. All the recipes are practical. And the book is FREE. So simply mail the coupon for it now.

The Cultivator Patterns

3436. Boys' Blouse and Knickerbocker Trousers.—Cut in five sizes: 6, 8, 10, 12 and 14 years. A 10 year size will require 1⅞ yards of 36 inch material for the blouse and 1⅞ yards for the knickerbockers. Price 10 cents.

3767. Ladies' Coat.—Cut in four sizes: Small, 34-36; medium, 38-40; large, 42-44; extra large, 46-48 inches, bust measure. A medium size requires 4¼ yards of 54 inch material. The width at lower edge is 2¼ yards. Price 10 cents.

3473. A Good School Costume.—Cut in four sizes: 8, 10, 12 and 14 years. A 10 year size will require 2⅛ yards of 42 inch material for the skirt, and 2⅝ yards of 42 inch for the blouse. Price 10 cents.

3788. Ladies' Apron.—Cut in four sizes: Small, 34-36; medium, 38-40; large, 42-44; extra large, 46-48 inches, bust measure. A medium size requires 5¼ yards of 36 inch material. Price 10 cents.

3803. Girls' Dress.—Cut in four sizes: 4, 6, 8 and 10 years. An 8 year size will reuire 3 yards of 27 inch material. Price 10 cents.

3489-3251-3475. A Smart Costume.—Waist, 3489, cut in seven sizes: 34, 36, 38, 40, 42, 44 and 46 inches, bust measure. Vest, 3251, cut in four sizes: Small, medium, large and extra large. Skirt, 3475, cut in seven sizes: 24, 26, 28, 30, 32, 34 and 36 inches, waist measure. To make the costume as illustrated will require 4¾ yards of checked material 38 inches wide and 2¼ yards of plain material. The width of the skirt at the foot is about two yards. THREE separate patterns. 10 cents FOR EACH pattern.

3785. Juniors' Dress.—Cut in three sizes: 12, 14 and 16 years. A 14 year size will require 3¼ yards of 38 inch material. Price 10 cents.

3469. Dress for Breakfast or Service.—Cut in four sizes: Small, 32-34; medium, 36-38; large, 40-42, and extra large, 44-46 inches, bust measure. The width of the skirt at the foot is two yards. It will require 7⅜ yards of 27 inch material for a medium size. Price 10 cents.

PRICE OF ANY OF THE ABOVE PATTERNS 10 CENTS EACH

HOW TO ORDER PATTERNS

Write your name and address plainly in full, give correct number and size of each pattern you want, and send 10 cents in coin or (1 or 2 cents) stamps for each number. In order to furnish our readers with the very best **NEW YORK** styles, all patterns ordered are filled in **NEW YORK.** Do not expect patterns under **Two Weeks** from date of order.

CATALOGUE NOTICE

Send 15c in silver or stamps for or Up To Date Fall and Winter 1921 Catalogue, containing over 500 designs of Ladies', Misses' and Children's Patterns, a concise and comprehensive article on dressmaking, also some points for the needle (illustrating 30 of the various simple stitches) all valuable to the home dressmaker.

PATTERN DEPARTMENT

California Cultivator Los Angeles

WAYS OF ECONOMIZING

By Martha

A large amount of the average family's income goes toward replenishing the wardrobe, and this expense can be considerably lightened if garments are properly taken care of. Plenty of coat hangers help out wonderfully in keeping clothes in good condition. Frequent pressing spoils the looks of cloth and injures the fabric, and the necessity for this can be avoided to a large extent if garments are placed on hangers as soon as they are taken off.

When stockings look too bad to wear with tan shoes, save up several pairs and use one package of brown dye for cotton, and recolor them. New feet quite reasonable in price can be purchased to sew on stocking legs after the feet are beyond darning.

To freshen up velvet, first clean it well, then hold it over steam with the right side up and brush the nap with a whisk broom, but do not allow the velvet to become too damp. You can have nice cuff links by using four pretty buttons, running a cord through the shanks of two of them and working over this with thread.

By watching the sales, picking up remnants, making over, and always getting a good quality of material, there can be a wonderful saving in the matter of clothing, not only for the children, but also for the adults, and many bargains in the way of household supplies may also be found there.

Many woolen fabrics will wash as easily and as well as cotton goods and by washing the best parts of old garments through warm suds softened with a little powdered borax, they come out soft, clean and of good color, and by using a good pattern they can be fashioned into stylish garments for the young boy or girl.

Fine white waists, collars, handkerchiefs and all dainty sheer materials last two or three times as long if they are never rubbed in washing, and by putting them to soak in warm borax soap suds, then lifting up and down and pounding with a wooden potato masher they come out perfectly clean without any rubbing. The fabric is softened and whitened after the soaking and you will find no better way than this to clean the pretty embroidered and crocheted things used for the bureaus and tables.

To prevent chairs and rockers from marking hardwood flors and wearing rugs and mattings, cut pieces of thick felt the exact size of the tips of the chairs and fasten on with good glue, and a long strip of felt can be glued on rockers. Old felt hats can be used for this purpose.

SEASONINGS HELP

You may argue that seasonings add practically nothing to the nutritive value of a dish and for that reason, when the cook suggests getting more of this flavoring or that, you may feel that there is wise thrift in doing without it and spending what you save that way in buying more food that is actually nourishing. But remember that the cheaper cuts of meat, the cheaper vegetables and thrift dishes need more flavoring to make them palatable. Without fresh butter and with a cheaper cut of meat, you need all the help that good flavoring gives.

It is well to vary your seasonings as much as possible. Here are the flavors that are good in puddings and other sweet dishes: vanilla, almond, orange extract, grated orange peel, lemon extract, grated lemon peel, cinnamon, cloves, nutmeg, allspice, ginger and juices from various berries and fruits as they come in season.

For savory dishes you have these flavors: pepper, black and white, ground pepper freshly ground pepper berries, which have a richer flavor than the ground article, cayenne pepper, curry, sage, summer savory, sweet majoram, thyme, bay, Worcestershire sauce, parsley, grated onion, celery seed, celery leaves, dried peppers, and mint. There are many others that will suggest themselves. Soybean sauce, that imparts such a delicious flavor to much Chinese cooking, is good when it is used with certain meat dishes. It can be bought at well equipped groceries. There are several proprietary meat sauces that will help out a lot in cooking cheaper cuts of meat. To be sure they may seem expensive, but remember that you will use but a few cents worth in each dish and that the difference between expensive cuts and cheap cuts is many, many times greater than this expense.

HOME DEMONSTRATION WORK

Home demonstration work carried on by representatives of the United States department of agriculture, cooperating with the state agricultural colleges, through an organization composed of the people of the community, was undoubtedly much better understood at the end of 1920 than it was the year previous. The relation of food to human efficiency, of clothing to health and economy, of improved household conditions and conveniences to living standards appears to have been more clearly appreciated. An increasing number of women are acting as local leaders of demonstrations and lending their support, encouragement and personal interest to home demonstration work. Membership in the county extension organization increased in practicaly every state, in several states as much as 50 per cent. All states in the North and West report work in 1920 in some phase of clothing, nutrition and home management. Food preservation was a project in every state but one, health in all but two, and food production by women, especially poultry improvement, was carried on in practically all the Western and Middle states.

SAUSAGE FOR COLD MORNINGS

Larded

Make balls of fresh pork sausage. Wrap each with a strip of bacon and fasten it with a skewer or toothpick. Fry slowly until a golden brown color.

Breaded

Dip links in egg mixture, then in fine bread crumbs and fry in deep fat. Serve with macaroni and cheese, buttered carrots and apple pie.

With Coddled Apples

Slice tart cooking apples about one-half inch thick after coring them. Cover with a plain sugar syrup and cook slowly until apples are transparent. Fry pork sausage links until a delicious brown. Serve with buttered lima beans, celery and apricot shortcake.

TO ACCOMPANY THE GIFT

With a Phonograph Record

Because the very thought of you,
Makes music in my mind,
Pray let me share the music true,
The sweetest I could find.

With a Book

I cannot make new worlds for you
Yet these closed covers truly frame
A wondrous world of rapture true—
Be pleased to enter in my name!

REASON ENOUGH

Susie: "Papa what makes a man always give a woman a diamond engagement ring?"

Her Father: "The woman."

—Chesapeake & Ohio Railway Magazine.

DECIDEDLY IN FAVOR OF IT

"I dunno what dis relativity is," said Uncle Eben; "but if it's what keeps dis earth from rollin' around loose in space an' bumpin' into somethin', I'm strictly in favor of it."

It has been said that every step saved the housewife in the kitchen means one more minute of happiness for her. If such is the case, some women must be leading miserable lives.

For weeks after a community picnic, more work and less grouching is done, asserts R. R. Thomasson of the Missouri College of Agriculture. Less profanity is inflicted upon the mules and heartier greetings are bestowed upon the neighbors.

To remove iron rust from a deliacte fabric, spread it with cream of tartar. Twist cloth to keep cream of tartar in place; put in a pan of cold water, and heat gradually to boiling point. It may be necessary to repeat treatment.

When over a group of callers polite
A wordless pause descends,
I think how terrible it will be
If this silence never ends..

R. McCann.

Oil Light Beats Electric or Gas

Burns 94% Air

A new oil lamp that gives an amazingly brilliant, soft, white light, even better than gas or electricity, has been tested by the U. S. Government and 35 leading universities and found to be superior to 10 ordinary oil lamps. It burns without odor, smoke or noise—no pumping up, is simple, clean, safe. Burns 94% air and 6% common kerosene (coal-oil).

The inventor, W. V. Johnson, 31 N. Fifth St., Portland, Ore., is offering to send a lamp on 10 day's FREE trial, or even to give one FREE to the first user in each locality who will help him introduce it. Write him today for full particulars. Also ask him to explain how you can get the agency, and without experience or money make $250 to $500 per month.

Livestock News Notes

H. C. Witherow of the Greenwood Stock Farm, breeder of Durocs, reports that he has been enjoying a satisfactory trade the past fall and that he is finding the hog business just about the most profitable of any of his farm operations. Dollar barley and nine and ten cent hogs make a combination that is hard to beat. It is more than probable that Mr. Witherow will announce a sale for the latter part of January.

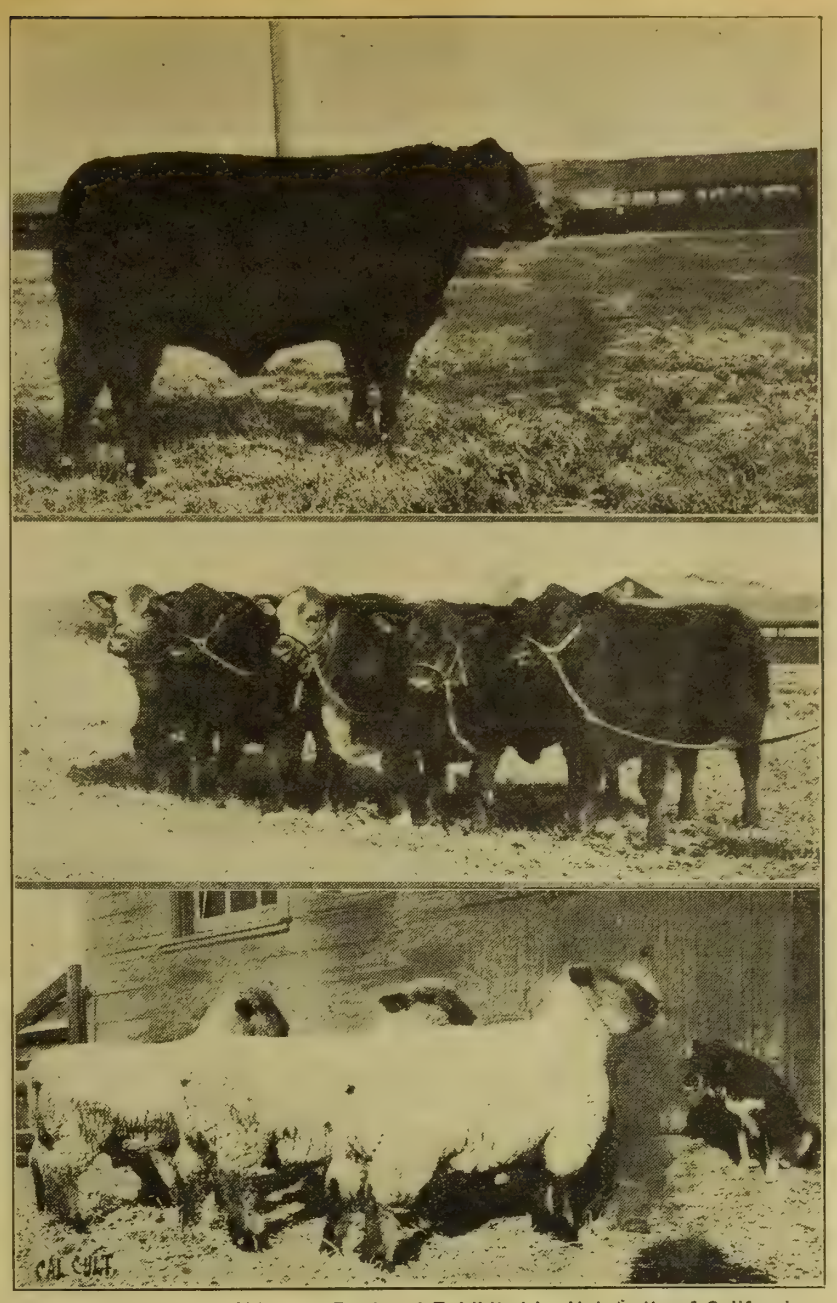
Mrs. Ruth Hardy, manager of Anchorage Farms, Orland, has sold 15 Berkshire gilts and a boar to the Weed Lumber Company, Weed. The same herd furnished two bred gilts to G. F. Lee of Oroville.

Three carloads of horses have been sold by a rancher near Gold Circle, Nevada, to a San Francisco dealer. The purchaser announced that the horses were for city users who are supplanting part of their light truck equipment with horse power.

Harlequin, the aged Hereford bull owned by the Pickering Farm of Missouri, was grand champion at the recent Royal show at Kansas City, and Lily Stanwat, owned by Cassidy & Son of Iowa, was the female champion. More than 300 head were shown in the various breeding classes and the show was declared to have been the best ever held at Kansas City.

Forty-eight head of senior and junior calves, sold without any warranty, made a general average of $280 at the Royal sale.

The attention of California Holstein breeders is now being centered on the activities of the McCloud River Lumber Company's herd, where some exceptional records have been made this fall, with others promised. Since October 1 four 30 pound records have been announced. McCloud Hengerveld Geertje came through with 30.29 pounds butter from 597 pounds milk six months after calving. McCloud Korndyke De Kol registered 31.54 pounds butter from 653.3 pounds milk at the age of seven years. McCloud Korndyke De Kol Mecthilde, a senior four year old daughter of the last named cow, produced 31.02 pounds butter from 643.1 pounds milk, and Buffalo Helio Bon Champ, eight years old, checked out with 30.39 pounds butter from 602.7 pounds milk. McCloud Princess Homestead, five years old, made 26.54 pounds butter from 640.2 pounds milk in seven days, and 107.24 pounds from 2,485.8 pounds milk.



Some Champions at Chicago. Bred and Exhibited by University of California
Upper: California Standard, pure bred Aberdeen-Angus steer, dropped October 15, 1920. Center: Group of five steers. Lower: Pen of pure bred Hampshire wether lambs bred and exhibited by University of California.

At the annual meeting of the American Hereford Association held at Kansas City during the Royal Livestock Show, John E. Painter of Roggen, Colorado, was elected president. Mr. Painter visited this state last spring and attended the annual Stockmen's Week at the university farm, Davis.

Following the plan of the Hereford breeders to offer bulls in carload lots at the spring sale to be held at Davis, the Shorthorn breeders are considering the possibility of including in their sale to be held at the same time bulls in sufficient numbers to attract range buyers. If both breed associations inaugurate this plan it will be possible for California range operators to fill their needs without scouting the state over.

A. W. Morris & Sons Corporation, Woodland, has made an arrangement whereby the university's Holstein herd will have the service of a richly bred son of Sir Aaggie De Kol Acme. This youngster is a brother in blood to the $12,000 Sir Aaggie Mead De Kol.

Rosamaines Dora Netherland, a two year old Holstein heifer owned by the Maxwell Farms, has broken the state record for butter in seven days in the eight months after calving division. When fresh this heifer made 21.66 pounds butter from 448 pounds milk. Eight months later she made 20.46 pounds butter from 441.6 pounds milk, showing a consistency in production that is wonderful. On semi-official test during the eight months she has called for a retest every month but one. She has been tested 14 times in the eight months and her butterfat in two days in her eighth month was one-tenth pound more than in her first month on semi-official test.

At a meeting of the delegates of 30 cooperative agricultural societies in Argentina, held at Rosario de Santa Fe, it was voted to organize offices in Buenos Aires, Rosario and Bahia Blanca for the sale of their products and for the purchase of agricultural supplies and machinery.

California Breeders

have sold more than $500,000 worth of registered cattle in our sales, under the most stringent requirements laid down by any sales organization in America. Satisfied buyers have been the rule in all our sales.

The California Plan of Livestock Auctions

By R. P. ROYCE

IN THE last issue of the Cultivator was pointed out that in the expansion of the auction plan of selling registered livestock in the older sections of this country a number of admitted abuses had developed and that some one or another of these abuses cropped out in sales from time to time. The more flagrant practices referred to were:

1. Wash sales.
2. Extensive use of personal credit.
3. Domination of breeders by fieldmen, auctioneers and livestock journals.
4. Lack of a uniform plan of selling.
5. Lack of satisfactory machinery for adjustments of disputes between buyer and seller.

It was also made plain that no general indictment against breeders of the pure bred industry was to be inferred. Rather it was sought to convey the idea that the practices mentioned occurred but occasionally, but the fact that they occurred at all tended to discredit, unfairly, the industry and caused the public to view the industry with skepticism.

The auction method of selling livestock in this state is of comparatively recent origin. Prior to 1917 but few sales of registered livestock were held during any one year. The reason for that situation obtaining was due to the fact that the pure bred industry in the state was of small proportions and that the marked development was due to appear from 1917 on.

Now it so happened that the Holstein business was the first to make substantial progress in California, and it also happened that, to a marked degree, the men becoming interested in that breed at the inception of the business were men of progressive notions and many were men of large business interests. These men, convinced of the soundness of the pure bred idea and the absolute necessity for fostering better livestock of all kinds in California, invested heavily in foundation material and during the course of assembling their herds they gained considerable insight into the general situation. In not a few instances they encountered experiences that left a bad impression. It was but natural then that when the point had been reached where surplus material had accumulated and was ready for sale these pioneer breeders found themselves facing a situation wherein the problem of selling loomed large. They could follow the common practice of selling by auction with the possibility of the introduction of such attendant abuses as have been mentioned, or they could evolve a new plan or so modify the old way as to eliminate as far as possible such evils as was felt were detrimental to the business. The latter course seemed to offer the most and the fact that no long standing practices existed in California, and further, the progressive temper of California ranchers, created a situation entirely favorable to an attempt to work out a plan of selling that would be an advance over eastern methods.

Starting with the idea that the production and sale of pure bred livestock was simply a business proposition, it followed that a sound selling system should be based on sound business practices. It was, then, following careful study of the whole scheme of producing and selling pure bred livestock that the California plan was evolved. Finally the machinery was perfected and an organization now known as the California Breeders' Sales and Pedigree Company, with headquarters at Sacramento, was launched and put under its own power in the fall of 1916.

So well has the story of this organization been told in a booklet issued in January of this year, that the following extracts are quoted to familiarize the reader with the general plan of operations:

"The idea of this organization originated in the mind of J. M. Henderson, Sacramento, California, at the time when he was becoming interested personally in registered livestock, and while he was looking ahead to the conditions surrounding the future market and marketing of registered breeding animals.

"Out of this study of conditions surrounding the production and marketing of registered livestock throughout America, came the conviction that the public sale was the most important factor in the selling end of the breeding business, and his investigations also indicated that in some of the older livestock centers of the country a great many abuses had crept into the public sale business, to the detriment of the best interests of the breeders.

"At that time California was just fairly at the beginning of public sales of registered livestock, and, in the interests of sound business for the breeder, the time seemed opportune to inaugurate a plan of selling at public sale that would accomplish several purposes, among them to head off the harmful practices that had grown up in other sections, to give California breeders a real sale service that would also be a potent factor in the advancement of pure bred livestock interests at all times, and to provide a reliable public market for the smaller breeders that would place them upon equal advantages of selling with owners of larger herds.

"At the time of organization it was unanimously agreed among the directors that the operations of the company would be directed strictly to the best service possible to render the breeders in its field, that no one of them would expect profit, salary or any other remuneration from the operations of the company, and that if any surplus should accrue it would be so handled as to benefit all breeders in its field.

"Later on, after the soundness of the plan of the company had been demonstrated, and there seemed no danger that stockholders would ever have to make up possible financial losses, a considerable number of representative California breeders were invited to buy one share each, on the same terms as the original issue of seven shares. In response to this invitation a meeting of the invited breeders was held, at which the sentiment developed that the present management and operation of the company was fully approved, and it was decided by them that no betterment of service would be likely to result with an increased list of stockholders and directors.

"The next step was to determine upon what terms registered cattle should be sold in the sales of the company, and a rough draft of a sales contract, including the guarantees, selling commission, and other features of a sale transaction, was submitted to a large number of the leading breeders of California for their approval or suggestion, and out of this was evolved a standard sale contract which has now been in force for four years, practically in its original form.

"It is worthy of note here that the contract of this company was the first in effect by any sale organization in this country which required every animal sold unqualifiedly guaranteed to be a breeder, a measure that has been of inestimable benefit to the hundreds of buyers of foundation animals in California sales, and a measure that has since been widely copied in the better sales throughout the country. For the information of any who have not seen a copy of this contract it is here reproduced in full:

CONDITIONS OF SALE

The following terms and conditions constitute the contract between California Breeders' Sales and Pedigree Company and the party whose signature appears as a consignor on the reverse side of this sheet:

1—None but registered animals will be offered to or received by the company.

2—Registry certificates must accompany all entries, together with application for transfer, signed in blank.

3—Tuberculin test certificates, signed by a veterinarian approved by California Breeders' Sales and Pedigree Company, must accompany the entry of all cattle over six months of age, and tests must have been made not more than sixty (60) days nor less than forty (40) days before date of sale.

4—The consignor agrees to permit the buyer to tuberculin test all animals sold, the test to be made by a graduate licensed veterinarian, such test to be made before cattle leave the sales grounds and in the presence of the seller or his representative if the seller so desires, and the consignor agrees to receive back at the purchase price any animals that react to this test. The seller to have no responsibility for any subsequent reactions.

5—The consignor guarantees every animal sold to be a breeder. If a female sold as bred proves not to be with calf, or an open female fails to conceive at first service, the buyer must report the fact within ten days after the female comes in heat, to both the seller and president of the California Breeders' Sales and Pedigree Company, in writing. If the buyer elects to breed to his own bull he will be given four months to try the cow. If she fails to conceive within that time she must be shipped back to the seller's ranch, and notice in writing given the seller at least four days in advance of shipment. If the cow fails to conceive within four months in the hands of the seller, he must refund immediately the full purchase price to the buyer. Expense of shipping back to the seller's ranch, and expense of shipping back to buyer in case cow is returned safe in calf, is to be shared equally by seller and buyer.

6—Cattle must be delivered at the place of sale, in good salable condition, forty-eight (48) hours in ad-

Profit From Your Cows

—that's what counts, doesn't it?

YOU keep cows for one reason only—for profit. But not all cows are profitable; some constitute an actual deficit at the end of the year. Many a cow that has every reason to produce profitably joins the ranks of the "poor milkers" just because her milk-making organs are below par.

Make no mistake about this—there are scarcely any so-called "poor milkers" that cannot be made to yield normally and profitably by the medicinal aid furnished by Kow-Kare, the great cow medicine. Every dollar spent for Kow-Kare will put itself, and something besides, back in the milk pail.

Kow-Kare is a cow medicine—not a stock food. It has positive medicinal qualities that act vigorously on the genital and digestive organs and make them function naturally. For a quarter century this famous medicine has been widely used as a preventive and unfailing treatment in such cow diseases as Barrenness, Abortion, Retained Afterbirth, Scouring, Bunches, Milk Fever, Loss of Appetite, etc.

Keep close watch on every one of your cows; at the first sign of failing milk-yield, use Kow-Kare according to directions and watch the result. Write us today for free copy of our valuable book, "The Home Cow Doctor."

Kow-Kare is sold by general stores, feed dealers, and druggists at the new reduced prices—65c and $1.25.

DAIRY ASSOCIATION CO., INC.
Lyndonville, Vt.

"Penny-a-Day Prevention."

Thousands of successful dairymen use Kow-Kare regularly a part of every week during the winter to keep the assimilation and digestion in good order and throw off disease. Many of the most serious disorders that arise during the calving period can be prevented by using Kow-Kare for a couple of weeks before and after. Don't overlook this suggestion.

vance of opening of sale, accompanied by owner or his representative; and must be fed and cared for by the owner until close of sale, and owner must attend to shipping after the sale.

7—Hay, grain and bedding must be furnished by consignor.

8—Owners or their representatives will not be permitted in the sale ring unless the occasion should make it necessary.

9—Consignments of bulls will be limited to one bull to every five females, unless otherwise arranged in advance.

10—A fee of ten ($10) dollars will be charged for each animal cataloged and not offered owing to sickness or injury; or offered and passed without a bid; or upon animals selling for less than $100 in lieu of commission.

11—A commission of 10 per cent upon the highest bid will be the entire charge for selling except as elsewhere stated, and as follows: On an animal selling for $500 and up to $750 the commission will be 10 per cent on $500 and 7½ per cent on the balance; on animals selling for over $750 the commission will be 10 per cent on $500 and 5 per cent on the balance. Full page pedigree charts of reference sires will be inserted in the catalog at an extra charge of $3.75 each.

11a—All photographs used in advertising or catalogs must be furnished by the consignor. If engravings are used in sale catalog a charge of $3.75 for each catalog page occupied by engravings will be made in addition to actual cost price of engravings.

12—All entries must be for absolute sale. There shall be no by-bidding directly or indirectly, nor any reserve. The consignor agrees to pay to California Breeders' Sales and Pedigree Company twenty-five (25) per cent of the price at which an animal is struck off if it is proven that the bid was a direct or indirect by-bid.

13—All defects or blemishes or unsoundness of any nature known to the seller must be stated at time of entry and upon the entry.

14—The consignor positively agrees that after having consigned stock to the sale mentioned on the reverse side of this sheet, he will not dispose of it by private sale, either prior to or during the progress of the sale, and he hereby contracts to pay a penalty of 25 per cent of the actual selling price as an agreed forfeit for a violation of this condition.

15—The consignor further agrees to the several conditions mentioned below: That no animal will be withdrawn from the sale, except in case of sickness or injury subsequent to the time of entry sufficient in its nature to prevent the realizing of a fair price; in which case the before mentioned fee of $10 will be paid.

16—That the consignor is the responsible party; the company simply an agent.

17—That the title of the property is guaranteed by the consignor to the buyer; and the consignor hereby represents that there are neither claims against, nor liens upon, nor ownership, in the whole or part, of any animal entered by him that can in any way interfere with its rightful sale or delivery, or that can hereafter deprive the purchaser of full, complete and peaceful ownership.

18—That the consignor will furnish a halter with each animal he sells; and that all defects and unsoundness of any nature known to the consignor will be stated; that no animal suffering from contagious disease; or that is vicious, will be sent by him to the sale; and that he will not consign a cow that has been bred without giving name and number of bull and date of service; that no animal that has aborted with or since last calf will be consigned unless so stated.

19—That the company is authorized to decline any bid made by intoxicated or disorderly parties, or by those who have defaulted on former purchases; or by any who, in its judgment, is not a reliable, responsible bidder.

20—That in case any purchaser fails to pay for and receive an animal struck down to him, said company is authorized to accept the same amount from another person; or to accept the next highest bid; or, if in its judgment it be to the best interests of all concerned, to put the animal up for sale the second time. But in any case where an animal is not paid for fully in cash, the consignor agrees to receive it back as unsold, without attaching any liability to said company, and this condition includes in its obligation the stoppage of payment of check or draft or any action of that nature.

21—The consignor agrees to defend any suit at law brought by a purchaser by reason and on account of sale of his animal or animals.

22—That in disputed cases, involving the accuracy of statements made by the consignor, the president of California Breeders' Sales and Pedigree Company is authorized to appoint a committee of three persons, and the decision of this committee shall be binding upon both seller and buyer, and if the consignor is in the wrong he agrees to pay the expense of adjustment; and the buyer agrees that if the above mentioned committee disallows his claim he will pay the expense of investigation.

23—That in case an animal is refused by a bidder on account of misrepresentation of the consignor, and that refusal is sustained by the committee, he, the consignor, will pay the full commission and receive back the animal.

24—That all settlements for animals sold must be made through California Breeders' Sales and Pedigree Company.

25—That California Breeders' Sales and Pedigree Company is authorized to withhold entire settlement on each and every animal for which registration certificate, and application for transfer signed in blank, has not been delivered to said company prior to settlement, until such time as said certificate and application have been delivered to said company.

26—That in case of an animal or animals sold subject to tuberculin test by the buyer, California Breeders' Sales and Pedigree Company is authorized to withhold settlement for such animal or animals until such time as said tuberculin test has been completed and the buyer has notified said company of his acceptance of said animal or animals.

The only variations from this standard contract in any sales have been as follows:

"In sales where the cattle were sold without tuberculin test certificates, clauses 3 and 3A were omitted.

"In sales of the beef breeds clause 10 was rearranged to meet special conditions present, and a minimum charge of $20 per head is made for animals selling for $250 or under. Also a special provision is made in sales of beef breeds that a female selling with calf at foot requires no further guarantee that she is a breeder.

"With no incentive for profit, the line of our operations was clearly defined, and in addition to the actual conduct of public sales it was decided to carry out a form of promotion work in connection with our regular sale publicity, that would be of direct benefit to the particular breed involved. The carrying out of this idea involved a larger expenditure for display advertising space in the various publications used, than would have been the case had profit been the result in mind, a more careful preparatoin of advertising copy, and the mass of detail work that precedes the actual preparation of advertising copy on registered cattle, and the maintenance of a very large and complete mailing list that would effectively cover the livestock field of the whole west.

"It was recognized at the beginning that two of the important contacts the breeder of registered livestock has in the public sale are with the auctioneer and with the publications which carry the advertising of the sale, both of which contacts have been sources of many of the public sale abuses. This company determined to solve this problem by the very simple expedient of placing value of service rendered on the part of any auctioneer or publication as the sole standard of judging usefulness to its public sales, and this policy has been strictly adhered to, without fear or favor.

"Again, its sale contract, which had actually been made by a large group of representative breeders, incorporated a number of advanced ideas in requirements made of the seller for the protection of the buyer, and yet were recognized by the most substantial breeders as necessary for the conduct of the breeding business upon a sound basis. It was determined at the beginning to enforce this feature, also without fear or favor, and this has always been strictly adhered to, and with a very few breeders unwilling to toe the mark.

"By adopting one big, comprehensive selling plan for the entire state, California breeders have made possible a greater certainty in the successful conduct of their sales than would have been possible had the sales been conducted in smaller units, or by agencies that were more local in character, scope and knowledge.

"In proof of the effectiveness of this plan of selling, every sale ever handled by this organization has gone through as scheduled, with two minor exceptions. In 1917 we conducted a consignment sale of Jerseys and after selling 40 head stopped the sale as the buyers present appeared to have filled their needs. In 1920 in a mixed sale of cattle, hogs and sheep, after selling the sheep and hogs satisfactorily, and part of the cattle, we stopped the sale owing to lack of interest in the balance of the cattle.

"In accomplishing its purpose to eliminate by-bidding, reserves or other protection to the buyer from California sales, which practices have always proved detrimental to the breeding business wherever practiced, our efforts have been highly successful. In only a few isolated cases has a suspicion of these practices arisen, and after investigation in each case the suspicion proved to be not well founded.

"In our total sales of 4,180 head of registered cattle only two buyers have ever defaulted in payment of their

(Continued on Page 615.)

"Cut the Price" Says Melotte

MELOTTE, the Edison of Europe, manufacturer of the greatest Cream Separator the world has ever known, announces a sweeping reduction in prices.

Labor conditions in general together with tremendous re-building and re-organizing efforts put forth by this big man of Belgium has resulted in cutting production costs to the bone.

And right now *at this particular time*, exchange rates are extremely favorable. Take advantage of this condition while it lasts. Get the most for your American dollar. Buy now and save money!

Belgium Imported MELOTTE Reduced 22%

Before buying any separator find out how the Melotte has won 264 Grand and International prizes and how, for Efficiency of Skimming, Ease of Turning, Convenience of Operation and Durability—the Great Belgium Melotte has won every important European Contest.

$7.50 after 30 Days Free Trial

This is the offer. NO MONEY DOWN—FREE TRIAL—SMALL MONTHLY PAYMENTS—DUTY FREE.

We will send an Imported Melotte Cream Separator direct to your farm on a 30 days absolutely Free Trial—no deposits—no papers to sign—use it as if it were your own separator. Compare it—test it in every way.

When you are convinced the Melotte skims cleaner, turns easier, washes quicker, lasts longer than all others, then pay $7.50 as first payment and the balance in small monthly payments until the separator is paid for.

Self-Balancing Bowl The Belgium Melotte is the only single-bearing-bowl separator ever made. This patented bowl hangs from one frictionless ball bearing and spins like a top. It is *self-balancing*. It skims as perfectly after 15 years' use as when new. Positively cannot ever get out of balance—cannot vibrate and thus cause cross currents which waste cream by remixing with the milk. The 600-lb. Melotte turns as easily as the 300-lb. machine of other makes. Spins for 25 minutes unless brake is applied. No other separator has or needs a brake. The Melotte bowl has solved the problem of perfect skimming.

Send This Coupon!

Fill out and mail the coupon for New Melotte catalog containing full description of this wonderful cream separator.

Don't buy any separator until you have found out all about the Melotte, its 15-year guarantee and our 30 Day Free Trial Offer.

Send coupon for full information and also revised price list showing 22% reductions.

We are offering California Holstein breeders a chance to buy a real herd header in

Tritomia Panzie Ormsby 352078

Born May 11, 1921

Sired by Tritomia Pietertje Ormsby

The great three year old son of Sir Pietertje Ormsby Mercedes and Grand Champion of the 1921 National Dairy Show. The dam is a granddaughter of Sir Ormsby Skylark and has a record of 1042.7 pounds of butter from 21024.9 pounds of milk as a senior three year old.

This calf was a show ring winner in four shows this year. He was first junior calf at San Francisco. Here is TYPE combined with PRODUCTION. Tuberculin tested and guaranteed a breeder.

The price is right. Terms to responsible parties.

Do not delay on this one as several Eastern breeders have inquired about him and some one will snap him up at the price.

MAXWELL FARMS

Jack Klein, Mgr. Hollywood, Cal.

MR. FARMER:—

You are contemplating the purchase of a service bull next year. Why not save 50 per cent of the purchase price by buying a registered Holstein bull calf now. Pay for him next year when he is ready for service.

Sons of SIR VEEMAN KORNDYKE PONTIAC, who has 27 A. R. O. daughters, and of BURR WALKER SADIE VALE, whose seven nearest dams average 29 lbs. of butter in 7 days, included in this offer. Call or write at once.

BURR FARM 26th and Downey Road, Los Angeles
RFD 2 Box 120

Tosantos Walker Mead

Born December 9, 1919
Exceptional Yearly Record Backing

His five nearest dams average over 1,000 lbs. butter in a year. He is out of a wonderful daughter of Prince Gelsche Walker and Sir Aaggie Mead De Kol. He is a show bull and is priced for immediate sale.

E. D. BARRY, JR. Workman and Azusa Ave., Covina, Cal.

HOLSTEIN *Fred Hartsook* RANCH **CATTLE**

We have assembled an excellent foundation herd of females and will be glad to have breeders call. Fred Hartsook, Lankershim, California.

SHEEP

Sheep—Improve Your Flock with a Reg. Shropshire Ram. This stock was blue ribbon winners in Southern California and Eastern State Fairs. Willis A. Barber, Station T, Rose Hill, Los Angeles.

PATENT ATTORNEYS

WEBSTER, WEBSTER & BLEWETT, Savings and Loan Bldg., Stockton, California. Established 50 years. Send for free book on patents.

MISCELLANEOUS

Powerene—County Rights Free. It equals gasoline at 5c. Adds power, prevents carbon, saves repairs. Guaranteed safe and harmless. To introduce, the equivalent of 20 gallons prepaid $1, if ordered now. P. Barnes, E Street, Cazadero, California.

Hemstitching and Picoting Attachment; fits all sewing machines. Price $2.00. Checks 10c extra. Light's Mail Order House, Box 127, Birmingham, Ala.

TURKEYS

GIANT BRONZE TURKEYS

Large turkeys can be raised at practically same cost as small ones. It is in the strain. One of our toms will give you 5 more pounds of meat to market in all his get the first year, besides vitality and beauty.

GOLD NUGGET STRAIN
J. Will Blackman, Originator

Won at California's two greatest shows, Gold Special Sweepstakes for best turkeys, California State Fair, 1920, against 66 of the State's best turkeys, also every 1st, 2nd and 3rd prize and Gold Special Sweepstakes at Los Angeles Livestock Show of 1920.

AN UNEQUALED RECORD

Toms and hens for sale; a few high class exhibition toms to win in any show or head any flock. Book orders early for December and January shipment, as each year we are sold out.
Address
BLACKMAN & MUMFORD
607 East Third St., Los Angeles, Cal.

Turkeys — Purebred Giant Bronze, male and female stock, sired by our two famous toms, "Goldbank Boy," champion Giant Bronze first prize winning cockerel at Madison Square Garden Show, New York, January, 1921, and "Copper King Jr.," a 36-lb. yearling son of "Copper King V.," the 38-lb. yearling that was grand champion at Madison Square Garden Show, January, 1919, both bred to choice 20-lb. hens. Eggs in season. Address Bronze King Mountain Farm, Calistoga, Cal.

The Wonder Turkey (Copper King V Strain) Giant Bronze. Do not buy inferior stock—it doesn't pay. Fertility of our eggs this season something wonderful—100 poults from 101 eggs—CAN YOU BEAT THAT? April hens and toms for sale—going fast. If you wish to be one of the lucky ones ORDER NOW. Livermore Turkey Farm, Box 627, Livermore, California. K. A. Flynn, Mgr.

It's no wonder so many poultry raisers make a failure of the business. Without any knowledge of raising poultry people will branch out expecting to make a success. By putting in practice the valuable contents of POULTRY FOR PROFIT, $1.00 postpaid, success is assured in the poultry business. Cultivator Publishing Company, Los Angeles, California.

Mammoth White Holland Turkeys—Choice hens and toms from our famous breed of large vigorous turkeys, improved by Eastern stock. Earl V. Smith, Loma Vista Ranch, Willows, California.

Pure Bred Bronze Young Toms, $15.00; young hens, $10.00. Pure bred S. C. Buff Orpington cocks, $5.00 each. Mrs. M. L. Trewhitt, Route B, Box 47, Hanford, California.

For Sale—Wild Turkeys—Best, cheapest, most certain and indispensable producers. Cash deposit secures stock or eggs. Blanche Dresser, Tulare, California. Route C, Box 194.

Mammoth Bronze Turkeys—Choice toms for sale. Prizes taken at Riverside Fair, 1921. E. H. Varley, Hemet, California.

Bourbon Red Turkeys, Buff Orpingtons. The Ferris Ranch, Reservoir Street, Pomona, California.

Mammoth Bronze Turkeys—Toms, $15; hens, $10. Mrs. Ida Philbrick, Route C, Box 289, Modesto, California.

Thoroughbred White Holland Turkey Toms $12. Hens three for $20. Pause Pheasantry, Fairoaks, California.

CATTLE

Bargain in a Four Months Ayrshire Bull Calf out of "Steybrae Lily" No. 60267 who is by "Lessnessock Golden Love" No. 20053. First prize winning bull Canada, 1918, and brother to sire of $8100 heifer at 2nd annual sale. Sire is "Tam o' Shanter" No. 24635, 1st in his class L. A. Stock Show, 1920, and out of an eight gallon cow. This animal is well grown and an excellent individual. Price $100. Papers furnished. Come see him. R. M. Cartwright, Gardena, California.

For Sale—Registered Guernseys, $100 each. Bull 5 years old, three young cows, all milking, two from imported parents. Free from Tuberculosis but not free from abortion. First check takes them. Address R. B., 2206 21st Avenue, Oakland, California. Ernest L. Bishop.

Guernseys — Grape Wild Farms — Berkshires—Young bulls, from calf age up to 16 months old, of May Rose breeding and out of A. R. cows. Bred sows and gilts, service boars and pigs of both sexes for sale. Grape Wild Farms, Escalon, California. A. B. Humphrey, Proprietor.

Berylwood Stock Farm—Breeders of registered Holstein cattle and Duroc-Jersey swine. Every cow an A. R. O. and T. B. tested. Bulls and females for sale. J. W. Snodgrass, Hueneme, California.

Shorthorns bred for range purposes and of Pure Scotch Blood Lines. Show herd won highest honors in 1917. Visitors welcome; information cheerfully given. T. T. Miller, Hollister, California.

Yearly Record Holsteins—Bulls from 500 to 1000 pound dams and by World Record sires. A. W. Morris & Sons, Woodland, California.

Breeders of Registered Shorthorns—Milk strain; choice young stock for sale. John Lynch Ranch, Box 321, Petaluma.

Registered Holstein Bulls of various ages for sale. Millbrae Dairy, Millbrae, California.

Polled Herefords and Durocs — Diablo Stock Farm, G. W. Emmons, Prop., Danville, California.

Some Choice Registered Holstein heifers and bulls of serviceable age for sale. J. W. Scudder, Escalon, California.

Winsor Ranch Jerseys—Bull calves with production behind them, at reasonable prices. BONITA, CALIFORNIA.

TREES

For Sale—Placentia Perfection and Eureka grafted walnut trees. Prices 1-3 off from last season. Our stock is grafted from choice grafted orchards. See our stock before buying. The Walnut Nursery, Whittier, California. Phone 6294.

For Sale — Walnut Trees — Erhardt and Placentia grafted on Northern Black Root—4 to 6 feet high, $1.00; 6 to 8, $1.25; 8 to 10, $1.50; 12-14, $2.00; Erhardt, 8-10, $2.25; 10-12, $2.50. Borley and Wilkins, Puente, California. Phone 162.

For Sale—Grafted walnut trees, also citrus and deciduous trees. Order now for 1922 delivery. Get my prices. Ketscher's Nursery, 1101 E. 4th Street, Santa Ana, California. Phone 572-W

Hachiya Persimmon Trees—Best of all persimmons. Also rhubarb plants for home and field. Fred. W. Kelsey, S. Rosemead Avenue, El Monte, California.

Reliable Trees and grapevines at a fair price. Write us for price list. We ship on approval. J. F. Miller & Sons, Healdsburg, Cal.

Trees—Tuscan Kling peaches, Sugar and French prunes, five to eight foot trees $35.00 per hundred. Johnson's Nurseries. Almaden Road, Los Gatos, California.

For Sale—Grafted Walnut Trees, Placentia Perfection and Eureka. These are well rooted and first class in every way. Rivera, California, C. E. Bullock.

For Sale — ATHEL OR EVERGREEN TAMARIX. Best tree for immediate windbreak and shade in hot dry localities. Leonhardt Swingle, Indio, Cal.

For Sale—Walnut Trees. Placentia Perfection and Eureka, grafted on black root. La Puente Walnut Nursery, Puente, California. Phone 103.

Florida Sour Orange Seedlings. Nursery, 100 Ventura Street, Altadena. Address, Paul B. Magee, Mecca, California.

For Sale—Fruit Trees, grapevines, unrooted grape cuttings, etc. Write for price list. Burke's Nursery, Lodi, Cal.

For Sale—One and two year old Wonderful Pomegranate trees. fine stock. J. W. Irwin, Lindsay, California.

For Sale—California Black Walnut seedlings, 1-3 feet. Ripon Nursery Company, French Camp, California.

Bishop's Nursery, Highland, California, will be pleased to figure on your order for trees, plants, or seeds.

Citrus Nurseries, Murphy Oil Company, East Whittier California. Selected stock for sale; inspection invited.

Quality Trees, grape vines, camelia, etc. Cash Nursery, Sebastopol, California.

PHEASANTS

Beautiful Chinese Ringnecked Pheasants $12 per pair. Pause Pheasantry, Fairoaks, California.

GEESE

Geese—Now is the time to order McNeely's Mammoth Geese, $5.00 each, as many as you want Chas. McNeely, Alpaugh, California.

GOATS

For Sale—Highest class pure bred and grade Toggenbergs. Milk goats. La Corona Goatery, El Monte, California.

THE CALIFORNIA PLAN

(Continued from Page 613.)

purchases, and decisive steps were taken in both cases to prevent a repetition on the part of the same buyers.

"In our sales of registered cattle it has been necessary to appoint a committee, as provided in clause 21 of our sale contract, on only two occasions. In one case the decision was accepted by both buyer and seller, and in the other was accepted by the buyer and rejected by the seller. The case was then taken to court where a decision was rendered upholding the decision made by the committee appointed under the terms of our sale contract.

"There has never in a single sale, or on a single animal, been a price that was not an actual cash transaction, with the exception of two defaulting buyers whose purchases were below the general average.

"In reviewing four years of sales it is with a great deal of satisfaction that we note that despite the very extensive promotion work carried on in connection with our sales, and despite the fact that real service and not parsimonious handling of sales has been our constant objective, this plan has provided for the breeders of California the lowest selling costs in effect anywhere in America.

"We find that the average commissions paid by breeders, including all charges for withdrawal of animals cataloged but not offered owing to sickness or injury, has been as follows: Holsteins, 8.87 per cent; Herefords, 8.5 per cent; Shorthorns, 9.1 per cent; Jerseys, 11.7 per cent. The relatively high percentages in the case of both Jerseys and Shorthorns represent an abnormal average that would not be present covering a longer period of time, as in both breeds we sold one large herd at a low average."

Next week an attempt will be made to show how far the practical operation of the California plan has succeeded in solving the problem of selling registered livestock at public auction.

Veterinary

Answers in this column by Dr. Wm. Petrie, 2714 South Harvard Blvd., Los Angeles, are without charge. For immediate mail answer remit $1.00. In writing questions give full symptoms or particulars of injury of animal.

Feeding Hogs Acorns

Is there any danger of brood sows aborting if turned out on acorns? Would acorns and grass pasture be sufficient for mature sows after breeding?—Subscriber, Ojai.

We see no reason why they should abort while eating acorns. We would not advise making the change abruptly. It is always best in making a change of feed to decrease what they have been getting gradually while increasing the new feed until they get used to it. If there are plenty of acorns, that with grass will surely be enough. In many places that is all that is given to fatten hogs.

Frost Nipped Alfalfa

Have been cutting green alfalfa for hogs. Not long ago a calf got some that had been frost nipped and died. Is there any danger in giving hogs alfalfa that has been touched by frost before cutting or alfalfa that has pretty well gone to seed? Would it be better to cure such alfalfa or all right to feed it green?—Subscriber, Ojai.

Frosted alfalfa is dangerous for feed while the frost is on because taken into the stomach ice cold will cause indigestion. Fresh cut green alfalfa is good but if allowed to wilt or partly cure will be more thoroughly masticated and less liable to cause indigestion. Hogs will probably like it better fresh and green but if you expect them to grow and fatten they should have grain with it. The ripe alfalfa would be better fed soon after cutting.

Injured Udder

Our cow seems in good health and eats well but has a lump in each of two teats. We turned her loose with a long chain with a block attached to keep her from going through the fence, and after that we noticed the lumps. She gives bloody milk from one of the teats. Is the milk from the others good to use?—Subscriber, Lathrop.

She probably injured the udder. Bathe it with warm water and when through bathing wipe it dry. The milk in the other quarters is probably all right. See "Congested Udder" in answer to another question in this department.

Worms in Hogs

Will you kindly tell me the formula for the use of concentrated lye in destroying intestinal and stomach worms in hogs?—Subscriber, Ensenada, Mexico.

We would not advise using concentrated lye for stomach and intestinal worms in hogs. If you wish to use something along that line give a dessertspoon of wood ashes in the feed once a day for a short time. A still better remedy would be a teaspoon of powdered areca nut mixed in a pint or more of sweet milk every morning for a week to each animal.

Congested Udder

What is wrong with our cow? The milk is stringy and mixed with blood. We feed both dry and green alfalfa hay and about three quarts of rolled barley per day. About two weeks ago she was off her feed but eats all right now. She has been fresh about six months.—Subscriber, Terra Bella.

It may be due to an injury, but probably to rich feed or exposure to the cold weather. Bathe the udder with warm water and wipe it dry. Also give a handful of epsom salts in the feed once a day for a week or ten days.

Gill
One-piece Piston Rings
flatten high hills

Because: where there are Gill Rings there is no such thing as wasted power. They press against the cylinder walls so firmly, so uniformly at all points; and their patented joint is so positive a proof against leakage that *nothing* wastes past them. *All* of the fuel is held in the firing chamber and compressed into power. *All* of the oil is kept down in the crank case and on the cylinder walls. There is *no* waste. And where there is no waste, there you find surplus power.

Edible Fish Meal vs. Fertilizer

IN LOOKING over a number of European publications dealing with poultry and hog feeding, we find evidence of an increased interest in the feeding value of fish meal. The feeders over there have evidently passed through an experience similar to that confronting the poultry and swine feeders in the United States. We find a marked distinction made between fish fertilizer and fish meal for poultry and animal nutrition. During the war period so called "organics," that is, protein derived from animal sources, was so scarce and high priced that manufacturers seemed to consider there was not going to be any hereafter. As a result much of the product made the last few years, owing to high moisture content and improper curing, was not suited for poultry and livestock feeding. Unfortunately this has resulted in a degree of unpopularity surrounding the use of fish meal which is not justified in so far as a high grade product is concerned.

Much has been written by scientists, and men who think themselves such, as to effect of vitamines in feeding material. Possibly the one of greatest importance is known as "Fat Soluble A." As might be surmised it is found in certain fats, not in every animal and vegetable fat, but only in a few, and one of the peculiar characteristics is the fact that these necessary fats, wherever found, are usually of an unstable nature, that is, they tend to lose their freshness readily. This vitamine under discussion controls the normal growth and development of the young. It abounds in butter, yolk of egg, the internal fat of fish and animals, and to some extent in the fat of the rice kernel. It is reported that thousands of children in the famine stricken district of Europe had their eyesight saved by small doses of cod liver oil which was furnished from the United States by the relief organizations financed in this country.

From these facts it will readily be seen that a supply of fish meal properly prepared is of great importance. The wonderful improvement made by stunted pigs when fed the proper kind of fish meal fully justifies all the claims made by investigators experimenting with smaller animals. It goes without saying that butter and eggs are too expensive for ordinary feeding purposes. However, there is no reason why a high grade fish meal should not be available to complete a properly balanced ration. Fats deposited on the outer portion of animals appear not to contain any "Fat Soluble A." It is only the internal fat.

Fish meal suitable for feeding purposes must first of all be prepared from raw fish which is perfectly fresh and free from taint. It should be dried without the use of excessive heat. In fact, light color is one of the characteristics which usually indicates a good grade of fish meal. However, the presence of acid or salt is not indicated by the color. A very dark fish meal is usually either overheated in drying or has been made from spoiled fish and as a result contains a very high fatty acid content. Properly prepared fish meal is unsurpassed for the feeding of swine, especially growing pigs. It is also very valuable as a poultry feed, and fed in the proper proportion will not taint eggs or flesh of the chickens.

Under ordinary circumstances California has a large supply of raw material at her back door, and it would therefore be to the advantage of consumers to encourage the production of high grade fish meal as a means of reducing the cost of securing the proper percentage of animal protein.

Dehydrating Plant at Los Angeles Harbor Where Tons of Waste Fish Are Converted Into Poultry and Stock Feed

The California Way

By Jean A. Koethen

WHICH is best, the California method of feeding, or the northern method, or the eastern method, or is each one best in its place? To how great an extent should climate influence method? How far should the amount of labor involved in a certain method be allowed to determine its efficiency? Is it possible that we of the great Southwest are too willing to save ourselves labor and bother? These and other questions are suggested by the following letter from a San Diego County subscriber:

"We have recently moved here from western Washington and find quite a difference in feeding methods. Therefore I would be very glad if you would discuss to whatever extent your space permits the advantages of the California system. Our ration and method of feeding are as follows:

"5:30 a. m.; sprouted barley, 1/16 to 1/4 inch sprouts, 20 pounds dry weight to 300 pullets and 50 hens.

"3 p. m.; 25 pounds wheat and cracked corn, 2 parts wheat to 1 of corn.

"5 p. m.; all the wet mash they will eat—sour milk used for mixing when available, which is about two-thirds of the time.

"5:15 to 5:30; cut green alfalfa, all they will eat.

"Surelay, oyster shell, grit and charcoal before them all the time.

"About twice a week I feed feterita in head for 3 p. m. feeding. Prefer oats to barley, but it is too expensive.

"It is my observation that most California chicken men do not feed wet or crumbly mash, neither do they bother to sprout grain. Some keep grain before chickens all the time in hoppers. Do you approve of this?

"From 150 seven months pullets and 150 six months pullets and 50 old hens we are now getting 96 to 100 eggs daily. This seems too low production. We fed no Surelay till pullets were six months old. Do you approve of that?"

Any suggestions or comments I may make must be taken with a grain of salt in view of the fact that the things we are accustomed to are nine times out of ten the things we approve. Let us consider first the debatable points in the above schedule:

The Philosophy of Greens

The place of green feed in a bill of fare is to supply not egg material, but vitamines which are essential to health and vitality. The hen on range, which is the natural condition of all hens, picks a little green, then a seed or a bug, then another bit of green. The more nearly the artificial feeding of greens can approximate the natural feeding the better for the hen, and so California poultrymen, acting on the advice of the poultry division of our own college of agriculture, feed their greens, when they can conveniently, about the middle of the forenoon, some at 9 o'clock, some at 10, in such quantity and containers that the birds may have some green before them in fairly fresh condition the rest of the day. The Southern California contest houses at Pomona are equipped with wire containers which are placed under the droppings boards and in the draft from the windows near the floor, so that they may be as fresh as possible all day, and a similar plan is followed by experienced poultry people.

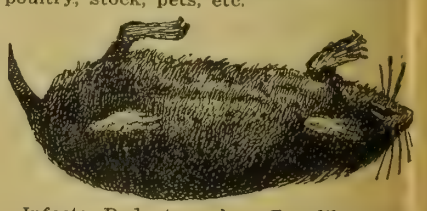
Kill the Rats New Easy Way

Amazing Virus Gets Every One.
Safe to Use. Not a Poison

Rats, Mice, Gophers — in fact all Rodents can now be wiped out easily and quickly. Imperial Virus will do it. This new discovery is a fluid, true Virus. Entirely harmless to humans, poultry, stock, pets, etc.



Infects Rodents only. Greedily eaten on bait. Sets up burning fever. The pests communicate it to others, and all die outside, hunting air and water. Imperial Virus is put up in sealed bottles, thus insuring full strength and potency. Only safe, sanitary method to overcome these pests.

YOU CAN GET YOURS FREE

Here's how! Send $1.00 today (currency, M. O., Check, etc.) and we will ship you by return mail, postpaid, two regular, full sized (double strength) $1.00 bottles of Imperial Virus. Use one to rid your place of these pests, and sell the other to a neighbor, thus getting yours free. Special inducements to represent us.

If more convenient, send no money, just your name and address to Imperial Laboratories, Dept. 723, 2110 Grand Ave., Kansas City, Mo. Pay postman $1.00 and few cents postage when package containing two bottles arrive. Guaranteed to do the work to your entire satisfaction within 30 days, or your $1.00 will be cheerfully refunded.

FOR GREATER EGG PRODUCTION FEED— COULSON'S EGG FOOD

FULL PARTICULARS IN OUR FREE BOOK "CHICKENS FROM SHELL TO MARKET"

Coulson & Co.
PETALUMA, CAL.

The hen is then free to nibble at mash or greens or shell or grit as she pleases.

Just what could be gained by feeding greens the last thing at night is hard to see. In Washington, which is a very green country, there may not be the same necessity for providing a constant supply of green that there is in this land of little rain, but in California greens are the sine qua non of poultry feeding.

Grain at Night

There are two reasons for feeding the scratch grain at night or shortly before bedtime. First, it is generally believed that, in order to produce satisfactorily, hens should go to bed with their crops full. They prefer grain to mash, and it is more slowly digested, therefore the logical time for grain feeding is when the hens have the whole night before them with nothing to do but digest their supper. They will fill their crops with grain, and all night long their digestive apparatus is busy turning protein and carbohydrates into eggs and energy. The hen that has her grain too early in the day will find herself with an empty crop long before morning.

Second, the custom of California feeders is to give so much grain at night that there will be a small amount left for morning. This may be a lazy man's reason. Of course the mash hoppers are before the hens, and they might worry along with mash alone till the master appears, but it seems to be a good thing for them to scratch a little in the early morning, and they have a little more enthusiasm for grain than for mash. There may be some California poultry people who get up at 5:30 to feed their hens. If there are, they are probably tenderfeet, for no real dyed-in-the-wool Californian would do such a thing when he could just as well prepare their breakfast the night before.

Hopper Feeding

How about feeding grain in hoppers where the hens may help themselves at all times? Some have tried this plan and are satisfied with it. A movement is now on foot, promoted by certain feed men and backed, I understand, by some experiment station (whether our own or not I am unable to say), to do away with the feeding of whole grain and keep before the hens a mixture of ground and cracked grain. Those who have tried this claim that it gives as good results as the old way of feeding. If it proves successful we shall no doubt hear more of it. As far as my own observation goes it makes little difference whether the grain is thrown on the ground or kept before the hens in hoppers or mixed with the mash. They will eat what they want and leave what they do not want. Throwing the scratch grain in deep litter serves the additional purpose of encouraging exercise, which is always a good thing, but straw has been so expensive of late that comparatively few poultrymen use it or at least enough of it to be described as "deep litter."

There is a good deal to be learned yet about feeding hens, and we Californians are most anxious to prove all things and hold fast what is good as well as what is the least trouble.

Wet Mash

Is it true that most California chicken men do not feed crumbly mash? Very few feed it all the time, but I know a great many feed it some of the time. Some feed it to the pullets in the fall when high production is especially desired; others feed it to their molting hens but at no other time. One very successful poultryman gives his pullets grain an hour before sunset, and then just as they are ready to go to roost places before them the wet mash moistened with sour milk. By this extra meal he claims to be able to avoid the fall molt which checks the production of so many early pullets. The majority, I believe, of those who use the moist mash, feed it somewhere from noon to 2 o'clock and give the heavy grain feed at night.

Sprouted Grain

A few years ago almost every poultryman used sprouted grain a part of the time; now I find very few who bother to do it. I used to do it myself, but I gave it up. Why? Well, it is a good deal of trouble, and nobody seems able to prove that the grain is more digestible or more nutritious sprouted than not sprouted, though it is more palatable. It does not take the place of green feed, and at certain seasons it is very difficult to keep it from becoming moldy. Planting the barley and cutting it for the hens during the winter season seems to serve every purpose that sprouting it in trays does and is more economical of labor. Back east, where no green grows out of doors in winter, sprouted barley or oats are a fair substitute. Here where barley grows in the ground from October to May, why should we sprout it in boxes? If I wanted sprouted grain I would bury it in my chicken yards, water it well and let the hens have the fun of digging it up. I have often done this, and it gives a real zest to life in the poultry yard.

Laying Mash for Pullets

When is the best time to begin feeding laying mash? I have met poultrymen who began feeding it to their chicks, diluted half and half with bran, as early as the third week. Others set it before them when the pullets are separated from the cockerels, at about two months, and nearly every one puts the pullets on it by four or four and a half months. The poultry division recommends putting the pullets on the laying mash at about four or four and a half months and then changing to a maintenance mash of bran and bone meal when the first eggs are seen. This is to prevent too precocious production and postpone laying till the birds are well matured. Other experts advise changing when the first eggs are seen from the laying mash to a ration containing more corn meal and cracked corn, to give the pullet some surplus fat, and then changing back to the laying mash when production can no longer be delayed.

A good all-around method of feeding is that followed by the California Egg Laying Contest at Santa Cruz, and I believe by that at Pomona. Dry mash is before the hens at all times. The scratch mixture, which consists of equal parts by weight of wheat, cracked corn, whole barley and milo, is fed an hour before dusk. At noon a small amount of dry mash is moistened (with milk if convenient) and fed in troughs. About 2 o'clock sprouted oats are fed. Chopped green feed is before the hens all the time in hoppers. The amount of grain fed, including the dry weight of the sprouted oats, is 10 to 12 pounds for 100 hens daily. This is a typical California ration and has given such satisfactory results that it may safely be followed by anyone who desires to improve his method of feeding.

Poultry Queries

Conducted by Jean A. Koethen

White Minorcas

Will you please put me in touch with breeders of first class White Minorcas in California?—Subscriber, Oceanside.

Will some reader who has such stock let it be known? There were no entries of White Minorcas at either the San Fernando or the Riverside fair.

Buttercups

Where can I secure Sicilian Buttercups?—Subscriber, Riverside.

I have mailed you the names of two exhibitors in recent shows. Breeders of this excellent breed would do well to let it be known through the advertising columns of the Cultivator.

Mating Pigeons

What do you mean by "mating pigeons"? I though they hatched male and female.—Subscriber, Alta Loma.

Pigeons are mated just as other birds are mated, only, as they mate in pairs, and are, like some other birds, rather particular about their choice of a mate, it is not always possible to know that they are mated till they have produced young.

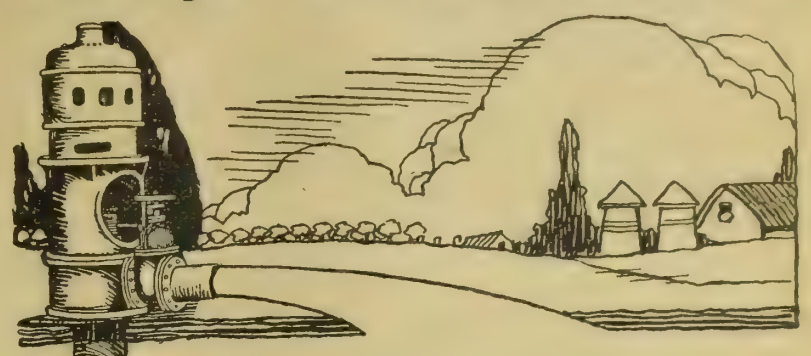
Sticktights

My chickens are infested by an insect that gathers in small bunches, generally around the eyes or under the bill. They jump like a flea and under a glass resemble one. The small chickens die from the attacks of these insects which stick their heads into the flesh around the eyes.—Subscriber, Vacaville.

These are not ticks, as you suggest, but sticktight fleas. You can kill them on the chickens by anointing several times with carbolated vaseline, but unless the house is thoroughly cleansed and all droppings and old scratching litter removed, they will soon be on the birds again. You can kill those in the soil by spading and wetting thoroughly with hot salt water or sprinkling with lime.

Planted too much of one vegetable and not enough of another in your garden last season? Might plan it on paper some of these days.

Crop insurance



HAPHAZARD farming is being rapidly put in the discard by keen agriculturists alert to the advantages of scientific methods developed largely in recent years.

The modern Byron Jackson direct motor drive centrifugal pump is an important factor in this new era of farming.

A Byron Jackson pump will insure you against drought and pay dividends in the form of capacity quality crops.

Byron Jackson service follows every pump through the period of installation and the years of its operation.

1000 Eggs In Every Hen

If You Keep Chickens, Cut This Out—Four to Seven Eggs a Week per Hen Through Cold Winter Season. With Eggs at a Dollar a Dozen, Means $5.00 Profit per Hen in Next Six Months. Amazing Poultry Secrets Revealed by

America's Foremost Poultry Expert

This is an offer no reader of this paper who keeps chickens can afford to ignore. We will tell you why.

Henry Trafford, Famous Poultry Expert and Breeder, for nearly eighteen years Editor of "Poultry Success," has developed a new and remarkable system of rearing, breeding and feeding chickens for heavy egg production that seems certain to revolutionize the poultry industry and give five eggs or more for every egg produced today. This plan or system is explained in Mr. Trafford's "1,000 Egg Hen," a free copy of which will be sent to any person who keeps six hens or more.

Poultry keepers, following Mr. Trafford's directions, learn how to start young pullets laying early; make old hens moult quickly and resume heavy laying during entire winter season. Most any hen will lay in spring when eggs are cheap. Mr. Trafford tells how hens lay four to seven eggs a week during coldest winter days when eggs sell at a dollar a dozen or more. His system shows how any breeder, with ordinary care, may get 1,000 eggs or more from nearly every hen in four to six years' time at a net profit of $25.00.

There is big money to be made with chickens this winter by the man or woman who gets the eggs. The time to get the hens ready for heavy winter laying is now. Mr. Trafford's "1,000 Egg Hen" system tells how and arrangements have been made whereby any reader of this paper may receive one copy absolutely free by using the Coupon below. Send no money, but cut out the Coupon and mail it with your name and address to Henry Trafford, 243E Court Bldg., Binghamton, N. Y., and the story of the 1,000 Egg Hen will be sent you by return mail.

Los Angeles, Cal. Dec. 10, 1921
Cultivator.

FREE COUPON

This Coupon entitles holder, provided he keeps six hens or more, to one free copy of Mr. Trafford's "1,000 Egg Hen." Write name and address plainly and enclose in envelope with this coupon. Address Henry Trafford, 243E Court Bldg., Binghamton, N. Y.

Persimmons: Lb., best, 10@15; others, 7@8.
Pomegranates: Lb., 5@8.

CITRUS FRUITS

Grapefruit: Market steady. Californias, northern: Packed box, 3.25@3.50; small, 2.50@4.00; Imperial Valley, 5.00@5.25. Arizonas: Seedless, 4.50@5.25, according to size and quality.
Lemons: Demand very limited, market weak. Locals: Special pack, mostly 4.00; market pack, 2.50@3.00; loose boxes, 1.00@2.00.
Oranges: Demand moderate, market steady. Navels, special brands, 216s to 126s, 4.75@5.75 fy.; 4.00@5.00 choice; market pack, 3.00@4.50, according to size and quality; culls, field boxes, 2.00@2.50.

HONEY

Honey movement in the past two weeks has been comparatively light and demand has fallen off to some extent. Prices remain practically unchanged and the light supplies on hand are likely to prevent any weakening in the immediate future. Some 1920 sage still remains on hand, but everything else now being shipped is of the 1921 crop. The supply is gradually cleaning up and little honey is expected to be available by January except mixed cars of goods in glass and tin containers and straight cars of honey in two and five pound glass jars. Car lot prices, per pound, f. o. b. loading stations: White sage, 11; light amber sage, 8; light amber alfalfa, 6½@6¾; white orange blossom is nominally 12@12½ per lb., but straight carloads are unavailable except by combining small lot offerings. Beekeepers are being paid 6@6½ per lb. for light amber alfalfa, and there is said to be more business in this grade than in any other California honey. Car lots of Hawaiian honey are quoted f. o. b. San Francisco: White, 6; light amber, 5½; honeydew honey, 4. Both inquiry and movement of Hawaiian stock are reported to be moderate.
Beeswax is practically at a standstill, a few small lots being sold at 20@25 per lb., depending upon purity of the wax and its color. On account of foreign importations eastern demand for California wax is negligible. Many beekeepers have opened up substantial outlets for their supplies through roadside stands, and an increasing quantity of honey is being disposed of in this way each year. The average roadside price for light amber honey is around 50 cents per quart can.

GRAIN AND FEEDS

Grain Exch. price bid Dec. 6:
Barley: 100 ton lots, Dec. del., 1.37.
Milo: 100 ton lots, Dec. del., 1.27.

HAY

Alfalfa Growers of California report:
Movement and offerings by growers light during week and can normally be expected to continue on a reduced scale during the winter months. Stocks in the hands of growers not large. Stocks in the hands of dealers and users smaller than usual.
There were 900 tons of grain and alfalfa hay received on the Los Angeles tracks the week ending December 3, with 170 tons holdover.
Prevailing prices last week, delivered in the vicinity of Los Angeles.

No. 1 dairy alfalfa	22.50
Standard	17.50

Quotations by Nichols-Loomis Company. Following are prices to growers f. o. b. Los Angeles in carload lots; handling and commission must be added to obtain retail prices on new hay:

HONEY

Demand has been better and movement heavier during last two weeks. Market firm, better feeling. Stocks continue to decrease. The heaviest movement is on light amber alfalfa; supplies of other grades, especially white stock, limited. Due to late rains, colonies in Southern California have more brood than usual at this date, and as a result winter stores are being consumed too rapidly. Carloads f. o. b. usual terms at loading points: White orange, no sales reported, supplies nearly exhausted; white sage, mostly 11½; light amber sage, 8½; light amber alfalfa, 6½@7, mostly 6½. Considerable California honey being sold by producers in small lots at prices averaging 3@7 per lb. higher than carload prices. Hawaiian carloads, f. o. b. San Francisco: White, 6½; light amber, 5; honeydew, 4. Beeswax: Quiet. Too few sales to establish market.

Your requirements, whether large or small, will receive our careful attention

Thompson Seedless: 48 15-oz. cartons, unbleached, recleaned, carton, 16 lb; 25-lb. bulk 14½; 25-lb. bakers' graded, unbleached, 17; 25-lb. boxes, choice, sulphur bleached, 18; 25-lb. extra fancy, sulphur bleach, 19; 25-lb, oil dipped, 15½; 25-lb. soda dipped, 15½.

London Layer Raisins: 3-crown London layer: 20-lb. boxes, $3.50 per box; 10-lb. boxes, $1.85; 5-lb. boxes, $1.00.

Clusters: 20-lb carton, clusters, $4.00 per box; 12 2-lb. carton, clusters, $4.80; 4 5-lb. cartons, clusters, $5.50 5-lb. carton, Imperial clusters, $1.50; 80-lb. vineyard run layer, $12.50.

Sultanas: 25-lb. box unbleached, recleaned, 13½ per lb; 25-lb. box, soda dipped, 14½; 25-lb. oil dipped, 14½.

Black Grapes: 25-lb. boxes black grapes, 14½ per lb.

Old Crop:

Muscats: 36 16-oz. cartons, seeded, 14½ per lb.; 25-lb. bakers' seeded, 13; 1-crown loose Muscats, 13½.

Sultanas: Sultans, unbleached, recleaned, 13½ per lb.

Thompson Seedless: Soda dipped Thompsons, 15 per lb.; oil dipped Thompsons, 15; black grapes, 14½.

Prunes, 1921 (Cal. Prune & Apricot Growers): Sunsweet Quality, bulk basis: 30-40s, 9¼; 40-50s, 8¼; 50-60s, 6¾, 60-70s, 6¼; 70-80s, 80-90s, 90-100s, 5½. Growers Brand ¼c less on all sizes. All prices subject to change at any time.

BEANS

Below California Bean Growers Association shippers' prices choice recleaned:

Large Whites	4.95
Small Whites	4.80
Pinks	4.60
Mexican Reds	4.50
Red Kidney	6.50
Henderson Bush	6.50
Cranberries	6.50
Bayos	4.90
Blackeyes	4.65

NUTS

California Almond Growers Exchange's prices:

Languedoc	14½
Hard Shell	11

Manchurian walnuts, 17.
Chinese peanuts, fy., 10.
Pecans, 25.

HAY AND FEED

California Alfalfa Growers report:

Prevailing prices last week, f. o. b. San Francisco:

No. 1 Dairy Alfalfa	16.00
Standard	15.00

A. W. Scott Co. says:

Arrivals past week, 789 tons. The local market here shows very little life and consumption is at a very low point. Cold weather up and down the coast would stimulate shipping trade. Interior market shows more activity. Alfalfa continues to sell better than other hay, particularly to inaccessible points, feeders calculating that with high freight rates it is cheaper to buy only the best grade of alfalfa with practically no waste in the feeding. Nevada alfalfa is being handled to the complete exclusion of California hay for the time being, as most of the California holders are now calculating that continued cold weather will create active local demand in their own immediate neighborhood and at prices better than the fixed market centers obtain for the Nevada. Coastwise trade has been particularly active during the week.

We quote today wholesale prices in carload lots as appear from dealers' transfers upon the markets in San Francisco (for prices to consumers, charges of switching, cartage, commission and handling expenses must be added, according to conditions).

Wheat hay No. 1	17.00@19.00
Wheat hay, fair grade	14.00@17.00
Tame oat hay	15.00@18.00
Wild oat hay	11.00@13.00
Alfalfa hay	13.00@16.00
Stock hay	9.00@12.00
Straw	10.00@12.00
Rolled Barley	29.00@30.00
Ground Barley	31.00@33.00
Oats, Rolled Feed	34.00@36.00
Bran and Millrun	24.00@27.00
Middlings	40.00@44.00
Coconut Meal	23.00@26.00
Alfalfa Meal	21.00@23.00
Cottonsed Meal	40.00@42.00
Sugar Beet Pulp	27.00@29.00
Molasses Tanks	21.00 Barr. 25.00
Milo Maize, Corn Meal and Cracked Corn	36.00@40.00
Scratch Feed	40.00@43.00

GRAIN

Sales on Grain Exchange:

Barley: Feed, 1.25@1.30; shipping, 1.30 @1.35.

Wheat: Mill, 1.85@1.95; feed, 1.85@ 1.95.

Red Feed Oats: 1.55@1.60; seed, 1.75@ 2.10.

Corn: California yellow, 1.45@1.50; eastern yellow No. 2, 1.37@1.40; No. 3, 1.36@1.38; No. 3 kaffir, in bulk, nominal; white Egyptian, 1.67½@1.72½; California red milo, 1.45@1.50.

Citrus Markets

Los Angeles, December 7, 1921.

Navels are meeting with fairly good holiday reception but in no case reach Valencia prices. Valencias, however, are now practically out of the market. They close their season with prices sometimes exceeding $12.00 at the eastern auctions. Holiday shipments of Navels from the Tulare section will be short of earlier expectations. A material reduction in the Navel output has been made by the severe windstorms of last week.

Shipments of lemons have been exceptionally light and eastern warehouses are being cleared up of surplus stock. F. O. B. quotations are running around $3. Receipts of foreigns are very light.

Shipments

Shipments of citrus fruits to date since November 1, 1921. Southern California: Oranges, 493 cars; lemons, 429; total, 922. To same date last season: Oranges, 626; lemons, 415; total, 1,041. From Central California to date this season: Oranges, 1,792; lemons, 12; total, 1,804. To same date last season: Oranges, 1,902; lemons, 25; total, 1,927. From Northern California to date this season: Oranges, 172; lemons, 2; total, 174. To same date last season: Oranges, 180; lemons, 1; total, 181.

AT THE AUCTIONS

TRACK ATTACHMENT FOR LARGE WHEELERS

A new track attachment for small tractors is now being manufactured by the Schmeiser Manufacturing Company at Davis. This has been designed by A. C. Johnson, who is one of the pioneer tractor designers and manufacturers in this state. Among his achievements is the design of the Yuba and Bean tractors.

The new attachment was recently tried out on a Fordson tractor at the university farm. It operates without lubrication. The drive sprocket is made of manganese steel and is 44 inches in diameter. The idler wheel is made of cast iron and is connected to the sprocket by an adjustable radius rod. As applied to the Fordson, the sprocket and track are but two inches smaller in radius than the regular drive wheel of the tractor. This company has manufactured land levelers, hay derricks, almond machinery and horse equalizers for a number of years, being one of the oldest manufacturing plants of agricultural implements in California.

An unofficial test of the track recently conducted on the university farm showed a considerable increase in drawbar pull on plowed ground. The Fordson with the track weighs 3,700 pounds. This added weight accounts for some of the increase in the drawbar pull. The attachment will be officially tested at an early date, and those interested may receive accounts from the Schmeiser Manufacturing Company at Davis.

By making an interchangeable hub this attachment can be applied to such small tractors as the Fordson, Samson Model M, International 8-16 and others of this type. The device does not interfere in any way with the use of swinging drawbars. A chain connection from the idler on the front of the track to the tractor frame prevents the track from turning over under extraordinary conditions.

Legal Queries

Louis B. Stanton, attorney, 343 Wilcox Building, Los Angeles, will answer legal queries in this department.

Immediate mail replies cannot be given except where fee to Mr. Stanton is paid. When replies are wished in Cultivator address query to 317 Central Ave., Los Angeles.

Joint Tenancy

Husband and wife own real estate jointly. There are minor children. In case of the death of either husband or wife does the property go to the survivor or do the children have a legal share? How can the survivor get entire ownership without legal proceedings?—Subscriber, Napa.

If the deed to the property runs to the husband and wife as joint tenants with right of survivorship, upon the death of either the whole title to the property vests in the survivor. The children have no interest. In order to establish the fact of death of record it is necessary to file a simple petition, showing the fact of the joint tenancy, death of the survivor, and publish order to show cause, which will be issued on the filing of this petition, and decree is then made establishing of record the fact of death and of the vesting of the property.

Cow Not as Represented

I bought two cows from a man who guaranteed them to be healthy and in good condition. One cow seems to be all right; the other is not. What is my remedy?—Subscriber, El Monte.

You doubtless have two remedies; one to return the cows and demand your money back. In case he refuses so to do you can place the cows with some third party at his risk, notifying him, and bring action against him for the purchase price of the cows, thus rescinding the contract. This remedy depends largely upon the exact representations and upon the fact that it is promptly taken. Under the other remedy you may affirm the contract and bring action against the vendor for such damages as arise from the breach of the guarantee made when the cow was sold.

Accounting Required

A induced B to buy lot from third party. B put up all of the purchase money. A, who handled the deal, took deed to property in his own name, subsequently made improvements on the lot, and thereafter collected monthly rentals and appropriated them to his own use. He subsequently sold the lot for four times the amount of the actual purchase price, together with improvements made. He now offers B in settlement his unsecured promissory note for the original purchase money. What redress has B in the case? B had no knowledge of the improvements.—Subscriber, Lancaster.

A was unquestionably a trustee for B. As such he was bound to act in the highest good faith and could obtain no advantage. He was not entitled to use or deal with the trust property for his own profit, and every presumption is against him. B may, therefore, bring an action against A for an accounting as a trustee and, at the option of B, A may be required to account for all of the profits made under the transaction or to pay the value of the use together with interest from the date of judgment at the legal rate.

WEATHER REPORT

San Francisco, Dec. 3, 1921.

Ranchers Plan Field Meets

Lower the Cost and Increase Production per Acre

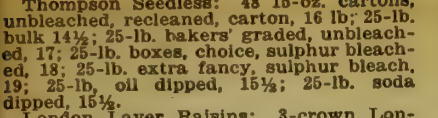
A series of field meets is now being held throughout Southern California, following similar meetings held successfully by the ranchers of the northern part of the state. Fourteen or fifteen such field meetings already have been arranged from Camarillo on the north to Chula Vista on the south and other meetings will probably be arranged by ranchers in many sections as soon as the successful results of these meetings become known.

The plan of the meetings is to make an intensive study of the problems and conditions of each district and by study and discussion to overcome the peculiar conditions of soil and climate.

Among the different Los Angeles firms, who have assisted at these field meetings, the service department of the Dixon & Griswold Co., 130 No. Los Angeles Street, Los Angeles, have been conspicuous. Their La Crosse Orchard Disc and Mold Board Plows, which were designed in California especially to meet California conditions and which are, in fact, the ideas of prominent California growers, have been in almost daily evidence.

As the result of the series of field meets throughout the state it is expected that costs will be reduced and the production per acre of California ranches will be materially increased.

Ranchers who would desire to attend the meets or who are interested in the new La Crosse Orchard Disc Plow will be given dates and locations of the meets and descriptive circulars of the La Crosse Plows upon application by postcard to Dixon & Griswold Co., 130 No. Los Angeles Street, Los Angeles, California.—Advertisement.



Pull 'Em Quick at Low Cost

Then Make Big Money Pulling Stumps for Others

Pull out your old stumps and hedges. Make every foot of your richest soil grow money-making crops. Then make big money pulling stumps and hedges for others. Write and get my price on our new improved **Hercules Stump Puller**—the fastest, easiest, cheapest land clearing machine ever made. Yanks 'em out, big or little, quick and clean. Easy to operate and move. Both horse and hand power machines. **$10.00 down—easy payments.**

"Made $62.50 in 3 days," writes one owner. Send today for Hercules catalog and Special Folder. Ask for Catalog No. 415

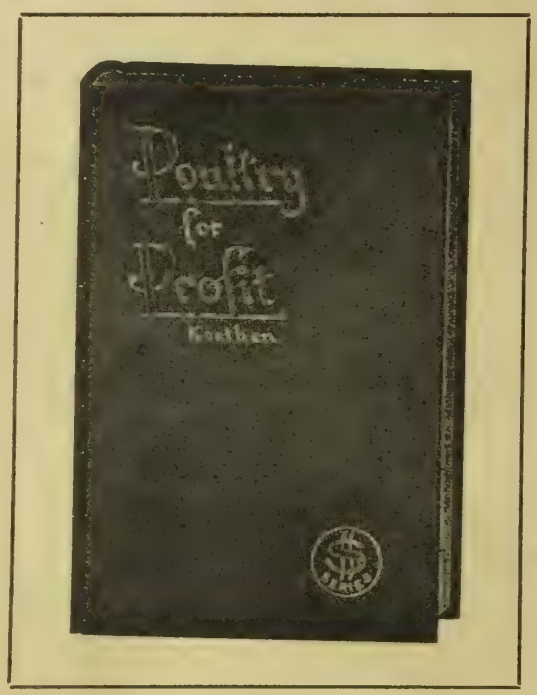
POULTRY Business can be made Profitable



Making use of information gathered from experienced poultry writers who have been guided by their practical experiences will always result in profit from poultry.

"Poultry for Profit"

By Jean A. Koethen

Gives more practical information on every branch of the Poultry Business and in a more concise and simple manner than any similar book published. With the knowledge gained by a study of this book, the necessity of practical experience is reduced to a minimum. By its guidance obstacles are overcome before it is too late.

Poultry for Profit is 5½x8 inches and contains 12 chapters, with over 225 pages of text and 18 pages of illustrations, printed on egg-shell book, binding full cloth vellum de luxe.

Some of the Valuable Information in this Complete Book

Making a Beginning
Marketing
Housing and Yarding
Sanitation and Hygiene
Incubation
Fixtures and Conveniences
Brooding
Diseases and Vices
Feeding
Ducks and Geese
Breeding
Turkeys

Works of the Western Electric Company; the manufacturing department of the Bell System

Economical Equipment

Forty years ago the management of the Bell Telephone System organized for a supply of the apparatus which it foresaw would be required in the development of its new industry—telephone service.

The telephone in some countries is the luxury of the rich, but in America it is used by practically all the people. This universal service is due in large measure to foresight in engineering and manufacture.

Switchboards with millions of parts, other apparatus of highest efficiency, and all necessarily of complex and intricate design, cables and wires and a multitude of technical devices enable our country to lead the world in telephone service.

All this telephone equipment is made in a factory which is recognized throughout the world as having the largest production and the highest standards of workmanship and efficiency.

This factory, controlled through stock ownership by the American Telephone and Telegraph Company, has been for forty years the manufacturing department of the Bell System; with the result that the associated companies secure equipment of the highest development, made of the best materials, produced in accordance with the requirements of the public, and with the certainty of moderate costs.

Economy in the Bell System begins with the manufacture of equipment.

"Tests on Oldsmar Heater show 100% Efficiency."—Prof. Peeples of Armour Institute

Frost Insurance at Minimum Cost

You insure your house, why not your crop? Fruit growers everywhere can have assured crop protection through the use of this improved and efficient heater which has a number of notable advantages over any other kind.

Oldsmar Frost Protector Costs Less To Operate

Five gallons of distilate fuel oil burns 10 to 15 hours according to temperature desired.

All cast iron (stack excepted), the Oldsmar is waterproof and cannot get out of order. Lighted instantly, it requires little attention and temperature regulation is positive.

An Oldsmar costs less than other cast iron heaters, lasts longer, requires fewer to the acre; affords complete protection — California and Florida grove owners and truck farmers are ordering them by thousands.

Write today for literature and full information about how the Oldsmar can protect your crop

OUR ADVERTISERS RELIABLE

We guarantee our subscribers against loss through dishonesty of any advertiser in the Cultivator. We do not attempt, however, to adjust trifling differences between subscribers and honest, responsible advertisers, nor will we pay the debts of honest bankrupts. Notice of complaint must be sent us within 30 days from date of the transaction, and the subscriber must have mentioned the Cultivator when writing the advertiser.

If among the more than 40,000 Cultivator's weekly circulation any fail to find any article they desire to purchase advertised in the Cultivator's columns, a special request is extended you to let your wants be known to the California Cultivator and we will place you in touch with proper parties.

The League of the Southwest has only been organized some four or five years. It is an organization sustained by voluntary contributions of its members and aims to provide an open forum where questions affecting the welfare of the southwestern states of the Union may be discussed. Its fifth meeting was held in Riverside last week.

* * *

We of the Southwest are wonderfully jealous of our home. We each have the best little nook of the best great empire in all the world. There is so much that is good in the possessions of each of us that we feel justified in the attitude we take. But this appreciation of worth is such that we insist on having all our own and where that insistence is too emphatic cooperation ceases.

* * *

So jealously did we guard our own interests at the Riverside meeting and so strenuously did we insist on having all of our own that it looked for a time as if the League would break up in a glorious row. But the give and take principle prevailed, at least to an extent, and it was found that "we are not so far apart after all."

* * *

It takes vision to translate possibilities to accomplish, and with such magnificent possibilities as there are in the Colorado there must be great vision, and the people of the Southwest will not perish because of the lack of that vision.

* * *

George Maxwell has not lost the fire which he had in the good old days of the National Irrigation Congress and in the days of the organization of the reclamation service. Those were the days when, as he said in the convention, "I was called George the Baptist and was little more than the voice of one crying in a wilderness." But the wilderness of the Southwest is smaller than it was, and George Maxwell is responsible for a whole lot of the enthusiasm and cooperation which were necessary to secure flood protection and irrigation.

* * *

"The development of the Colorado is not possible without the aid of the federal government" was the statement often made in the discussions at Riverside. Notwithstanding state rights beliefs the best interests of all must prevail, and they canot unless we have one great comprehensive plan under direction of one head.

* * *

The Imperial Valley is in greater danger than most of us are aware. This danger comes from two sources. First, the flood season of the Colorado, and, second, the flood season of the Gila. Fortunately these flood seasons have never come at the same time. But the Gila seems to be a law unto itself, and if its flood crest ever comes at the same time as the crest of the Colorado flood, and the levees of the Imperial Valley ever break, God help the farmers on a million acres of Southeastern California and Northwestern Mexico!

* * *

The greatest good to the greatest number will doubtless be the policy of the government which controls the waters of the Colorado, and we believe this will result in justice to Arizona. Of course Arizona and other states might receive more immediate financial returns if these great sites were thrown open to appropriation by public utility interests, some of which have pledged to their stockholders eight and one-half per cent on money invested in their stocks. Presumably these same companies would be willing to pay to various states a percentage on income derived but this would certainly work an injustice on the people who owned those rights for all time to come. Let the government keep control; let the people have the power at cost.

* * *

If Colorado, or any other state, could make good its claim to absolute ownership of all the waters within its boundaries and then should permit those waters to escape and injure other states, it would be a reasonable presumption that she would be responsible for any damage those waters might cause, and if, for instance, the waters should break Imperial Valley dykes and a half a million acres be covered 50 feet deep, is the state of Colorado prepared to compensate for those damages?

WINDBREAKS PAY

We have taken a 120 mile ride through wind swept orange groves in citrus sections. The injury is not so serious as anticipated. It is enough, however, to make outstanding the value of windbreaks. Where injury is most severe there was unobstructed sweep of the winds, while in adjoining or nearby orchards, where windbreaks were properly placed, there was practically no injury to trees and greatly lessened injury to fruit.

Strong growing trees which are of highest value as windbreaks undoubtedly exhaust soil of moisture and fertility, and a few rows of fruit trees may suffer unless exceptional care is taken to restore the water and fertility. But the advantages to those same trees and others in the orchard we believe have amply justified the cost of windbreaks.

THAT WIND

It was really quite a wind which started over on the Mojave desert somewhere, vaulted the Sierra Madre and dropped on the orange groves, touching various high spots on the way to the sea.

The injury is not as serious as at first feared, yet there are trees split or twisted off, a few fruits blown off and more thorned and bruised. As yet there have been no extremely low temperatures which often have followed the windstorms, but we are still fearing and many an orchardist is filling his heaters and watching thermometers.

Manager Blackwell of Glendora Lemon Association estimates not over 20 per cent of lemons of the section injured, with a large salvage possible.

COURTESY—JUSTICE

Was there lack of the usual California courtesy in the action of California delegates at the meeting of the League of the Southwest when they refused to grant the request of Colorado and practically surrender the birthright of their state in the wonderful wealth of the Colorado? Colorado boldly asserted her belief in the possession of all the waters which are within the boundaries of that state and equally as boldly declared "we will protect these rights to the last ditch and carry every feature of the fight to the supreme court." Speeches, covering hours, in which the sovereignty of the state was set up were delivered. A great mistake on the part of California in giving force in its laws to the age old riparian rights was alleged. In fact, some speakers could easily show that California is entitled to none of the Colorado's waters.

Then with this foundation laid six states united in asking of California as an expression of her world renowned courtesy to step down and out and allow the six states to courteously fix us a plenty. "And if (with heavy emphasis on the if) you refuse us this courtesy we will refuse to participate and your League of the Southwest will consist of simply your own state of California."

Fortunately the constitution of the League was disclosed to be in force as it had been adopted.

It is apparent from the expression of Secretary Fall of the Interior that the reclamation service will continue its oversight of the lands and waters of the Southwest and that the people as soon as possible will have the great heritage of light and power and water for irrigation, which is now wasting into the sea, made available. To turn this task over to seven "sovereign states" will simply mean chaos.

But was California courteous? She was certainly just.

PREFERENTIAL RIGHTS

Notwithstanding "sovereign states" and "states' rights" talk at the League convention and at Secretary Fall's hearing at San Diego was not received with super-enthusiasm there was an appeal in the address made by Governor Sloan of Arizona to Secretary Fall. Californians had held the floor nearly all of Monday and appealed for flood control that Imperial, Palo Verde and Coachella Valleys should not be destroyed; that dams be erected and hydroelectric power generated—and by the reclamation service—and the power delivered to the people and at cost.

Governor Sloan made no claim to states' sovereignty, but he did call attention to the map of the Colorado basin and to the fact that practically all the dam sites were within the boundaries of Arizona and that the development of those sites and turning of practically all those resources over to California or other states would result in depriving Arizona of one of her greatest resources, and he made the appeal of a strong man to a great government to deal with his state so as to make available to that state so far as possible one of its greatest industries.

COOPERATION

Until people can learn the meaning of the word cooperation there will not be fullest success in developing this great Southwest. As Mr. von KleinSmid said: "These are the seven best states of the Union." But the best can not be secured for these states unless a more truly cooperative spirit can be manifested than was shown at Riverside. Cooperation was on the banner of all the delegates, but too many of the speakers allowed it to appear that their idea of cooperation was in effect "You all cooperate with me." Cooperation calls for a program of give and take, and he who insists that either he or his state is supreme is not a true cooperator nor truly patriotic.

The wonderful wealth of the Colorado has all too long been allowed to waste, and destroy as it wasted into the Gulf of California. According to Colorado's idea, as expressed at the convention, the waters of the Colorado river which fall within the boundaries of the state of Colorado are the property of that state. Then naturally Wyoming, New Mexico and Arizona could claim similar ownership. Under such belief California would measure her interest in the Colorado in drops rather than cubic feet per second, for as a watershed California has practically no interest in that great river. In consideration of the fact that California has utilized the waters which have been going to waste and has built up great agricultural values through the use of that water, she insists—and all fair minded grant that she insists justly—in the continued use of that water. But California's cooperation should be as hearty as that she expects from the states up the river and the storage of the floods for use in those states should be encouraged and made possible through California's cooperation. If every state proposes to insist on all the rights it has or can secure without consideration of others it will be one long time before the wealth of the Southwest will be built up as it should be by the Colorado. It takes cooperation and the spirit of enlightened selfishness if we would see these great forces of nature turned into comforts for human beings.

California Cultivator

Vol. LVII, No. 25 Los Angeles, December 17, 1921 One Dollar Yearly

Protecting Orchards From Wind

By Ernest Braunton

THE late severe windstorm has revived the subject of windbreaks, especially with growers of citrus fruits, for it came at a time when trees hung heavy with fruit and in many districts orchardists suffered serious losses. In the infantile days of the citrus industry windbreaks were considered a necessity almost everywhere, for mile upon mile of young orchards had no other protection and the winds were strong and merciless.

With further and closer settlement of these districts came the planting of highway trees for ornament, plantings about the homes, the farm woodlot, etc., until windstorms gradually ceased to be such a serious menace as formerly. In some sections of the citrus growing territory windbreaks were gradually cut down as unnecessary by reason of the development of many promiscuous plantings mentioned and also because of the great pull on orchard fertility. It was found that the quickest growing tree was the eucalypt and later it was apparent that it was also a most rapacious seeker after orchard fertilizers. Harrowing tales were told of finding eucalypt roots in the orchard 50 or more feet from the base of trees and within the upper feeding zone of the citrus trees. To still have this wind protection and yet harvest a fruit crop from orchard trees nearest these arboreal monsters the growers paid them tribute by giving extra irrigations and applications of fertilizers to the rows of orange trees next the windbreaks, so that such fruit trees would produce their pro rata of the season's crop.

Curtailing Soil Robbing

Many orchardists dug ditches between orchard and windbreak and cut through all orchardward roots to a depth of three feet. Some even ditched and destroyed to six feet deep. At least one orchardist put in a concrete wall before filling in the ditch, thus forever removing the menace. Ofttimes adjoining property was adversely affected. Near La Verne, Los Angeles County, the large Seth Richards orchard, an early planting, had a double row of eucalypts on the north side, along the county highway. Orchardists on the other side of the highway claimed this proved a barrier to atmospheric movement along the surface, damming back the damaging frosts and thereby injuring their fruit crops. After years of protest one-half the eucalypts was cut away and no damage came to the owner's orchard. Then followed the remaining half and no harm came to anyone as the result of this clearance. The manager told the writer the planting was largely for frost protection, winds had been subdued by subsequent plantings, the orchard trees were so large and thick that frosts could not injure as when trees were small and far apart and the dual protection, from wind and frost, therefore no longer needed. About this time many windbreaks were cut out and the planting of young ones was not so popular as "in days of yore."

The Present Situation

The result is that today there are fewer windbreaks and of less extent, compared with citrus acreage, than ever before. Long continued heavy winds therefore sweep unbroken across vast areas of citrus orchards and the resultant heavy losses cause owners to ask if they had not better plant windbreaks, and of what material.

Before enumerating the various trees for equally varying climatic and other conditions it may be as well to state that soil robbing is no longer feared. Since the advent of the powerful farm tractor the cost of effective root cutting has been reduced to where it is not a serious item in orchard expense. When trees of rapid growth and far-reaching root systems are planted a root cutting machine is annually run through between orchard and windbreak and offending roots cut. The trees then push down roots in a deeper zone and below a certain depth these are allowed to extend as they will. In San Bernardino County the writer saw a tool that cut all roots to a depth of three feet, a subsoiler with a chisel or knife blade front. This, with a 75 horse power tractor, cut 15 miles in a day. The owner said he could put on a longer chisel and do as effective work four feet deep. A tractor demonstrator lately told the writer he would be pleased to show that he could do this in the heaviest of soils, even hard pan. The usual practice is to cut once in two years, running down one side of tree row one year and down the other side the next year. Orchards so treated for four years were closely inspected and the nearest trees appeared to carry as good crops in all respects as those farther out in the orchard.

The Eucalyptus Makes Effective Windbreaks

What to Plant

No other trees make such rapid growth as the species of eucalypts most commonly planted in California. These are the blue gum, Eucalyptus globulus, and the two red gums, E. rostrata and E. tereticornis; all much alike in rapidity of growth, habit and hardiness. Where summers are extremely hot and winters too cold except for the hardier citrus trees or none at all, Eucalyptus viminalis is the better species. This has been amply proven in the Imperial, Coachella and Antelope Valleys. Sometimes but one row is planted, in other places as many as four rows will be found. No argument on the number of rows need be herein set down; the needs of the situation should dictate. It has been urged that eucalypts early lose their lower limbs and let the blast onward sweep but little impeded. When a double row is set the inside row is topped when lower bareness is first manifest, causing a generous branching. When these lift their limbs through natural denudation, the outer row of trees is cut down and so the alternation proceeds for future years.

Another popular method is to plant the inner row of Monterey cypress. These do not rob the soil as the eucalypts and yet so compete with them for plant food that the eucalypts develop a root system mainly on the opposite side. When aligned by the roadside this is a decided advantage as the eucalypts then feed largely from the aforementioned roadside and the orchard trees escape the entangling alliance in which they ever come out a decidedly poor second. For quick and effective windbreaks the trees listed are certainly preferable to any planted in California. Yet there are others.

Sometimes deciduous trees may be used—summer winds may prove the

Agricultural News Notes of the Pacific Coast

Northern California

Novato, Sonoma County, is becoming an important poultry center.

Demonstrations of long pruning were conducted in Placer County last week.

The Glenn County farm bureau has opened a farmers' meat market at Orland.

Effort is being made in El Dorado County to revive the potato growers association.

The supervisors of Butte County have cut out appropriation for assistant county agent.

The Flournoy farm center of Tehama County is planning a jack rabbit drive Christmas week.

Tehama County farm bureau is planning to buy a moving picture machine for educational purposes.

Assistant Farm Adviser Buster of Sonoma County is making survey of the poultry industry there.

The newly organized Lassen County farm bureau starts with 103 charter members and 10 local centers.

Several olive growers have made a profitable business of shipping green olives to eastern markets to be processed by the buyers.

Local meetings of the Tehama County farm bureau will be held at El Camino, December 19; Liberal, 22; Flournoy, 30; Bowman, 31.

Local farm bureau meetings will be held in Shasta County at Redding, December 17; Cottonwood, 19; Bella Vista, 21; Millville, 27; Palo Cedro, 28.

A short course in general agriculture will be given at the university farm at Davis, January 2-7. This is particularly intended for prospective settlers.

Local meetings of the Napa County farm bureau will be held at Soda Canyon December 17; Oak Knoll, 19; Tucker, 20; Union, 21; Polk, 23; Mount George, 24; Chiles, 27.

Rumor that dipping of sheep brought in from Oregon for grazing in national forests of this state is no longer required is emphatically denied by Dr. Iverson of the department of agriculture.

Asparagus growers of the Sacramento delta district met at Walnut Grove recently to discuss formation of a marketing association. A committee was appointed to take preliminary steps.

In spite of effort of buyers to depress the turkey market for Thanksgiving several San Joaquin Valley raisers report good returns. Mrs. H. H. Goodman of Elliott netted 50 cents a pound.

Cattle range on railroad lands is from 25 to 50 per cent lower than in 1921 and Cattlemen's Association is urging renters to note this fact and make sure that they are not signing contracts on last year's terms.

A plan is being presented in Placer County for impounding flood waters of Bear River to supply the recently formed irrigation district covering Mount Pleasant, Gold Hill and the lower section of the Mount Vernon district.

The public utility department of the state farm bureau is canvassing users of electric power for funds to be used in securing data to present before the railroad commission the farmer's side of the power question in connection with revaluation of public utility properties.

Central California

Fresno County farm bureau is in the middle of its membership campaign.

Waldo Rohnert has been chosen state federation delegate for San Benito County.

The first carload of Porterville oranges to reach Boston this season sold for $6.90 per box.

The Orange Cove packing house has just sent a carload shipment of fancy Emperors to Mexico City.

The Kings County farm bureau held its annual banquet at Hanford, December 5. Over 500 attended.

More than 650 applications for state loans have been received from ex-service men in Fresno County.

Work has begun on the 300 mile stretch of highway between Naranjo and Lemon Cove in Tulare County.

There is talk of the formation of an irrigation district in the Kings River bottoms near Sanger, Fresno County.

Farm bureau centers in San Benito County are conducting their membership drive. Dues are $2.50 for the year.

Grape growers and shippers met at Dinuba recently to get together on a standard for drum shipments of Emperors.

This week a tractor school is being held at Tulare. This is one of a series of 14 being offered by experts of the state university.

A meeting of agricultural instructors of high schools of the San Joaquin Valley was held yesterday and today at Fresno.

Fresno County Historical Society is planning to celebrate next April the fiftieth anniversary of the coming of the railroad to central California.

L. R. Payne, chief of the inspection department of the Sun-Maid Growers, is making an inspection trip through southern states studying the quality of the Sun-Maid product as it reaches consumers.

The Stanislaus Poultry Association held a big show at the Winter Garden, Modesto, December 6-9. C. G. Hines of Oakland judged all exhibition classes; Prof. Dougherty of the university, utility classes.

San Benito County has had the services of the University of California agricultural extension service since September 1. W. J. Tocher, formerly assistant farm adviser in Santa Cruz County, is adviser.

The Porterville chamber of commerce has on display apples from the mountain ranch of George Dillon near Milo, from the same trees which produced apples winning first prize at the world's fair in Chicago in 1893.

At a meeting last week at Lindsay, Tulare County, 60 packing house managers of the Mutual Orange Distributors gathered to hear report on Tulare district crop. The expected increase of 20 per cent over last year's shipments has failed to materialize because of small sizes.

The San Benito County farm bureau conducted the third annual county fair in September. Every one of the farm centers put in a splendid exhibit. The judges had a hard time to select winners. Union took first prize as a center exhibit, San Juan Valley second, and Southside third. The total attendance at the fair was about 5,000.

Southern California

Ventura County is asking federal aid in building the Ventura-Maricopa road.

The San Dimas Canyon dam is now three-fourths completed at a cost of $240,000.

The Hemet-San Jacinto Poultry Association is planning to hold a show at San Jacinto some time in January.

Tree pruning demonstrations were given in Imperial Valley this week by W. P. Tufts of the state university.

The office of county flood control is driving piles in the stream bed under the San Dimas-Cienega bridge near San Dimas.

The Highgrove Fruit Exchange packing house opened this week on Navels. Secretary Cummings says that wind damage is slight.

More than a thousand accredited delegates attended the conference of the League of the Southwest at Riverside last week.

About three-fourths of the grapefruit growers of Imperial Valley are now organized in the Valley Grapefruit Growers Association.

Southern California last year shipped 3,205 carloads of cabbage; Florida, the next large early cabbage producing state, sent out 2,528 carloads.

The San Bernardino County farm bureau has gone on record as favoring the development of the Colorado River and construction of the Boulder Canyon dam.

Manager Foster of the San Dimas Fruit Exchange says that careful survey of San Dimas and Charter Oak districts shows very slight wind damage to fruit.

Ranchers of Carpinteria Valley of Santa Barbara County are considering a great irrigation plan that includes securing of water rights above Matilija Hot Springs.

A regional conference of county farm bureau presidents was held in Santa Ana last week to draft suggestions for the state program of work for the coming year.

Contract for eight and a half miles of paving has been let by the state highway commission for highway between Naples and Gaviota Creek in Santa Barbara County.

Formation of a flood prevention and water conservation district to include Orange, Riverside and San Bernardino Counties was proposed at the citrus institute at Santa Ana last week.

Attendance at the citrus institute at Santa Ana last week showed particular interest in the outlining of plans of the citrus exchange for establishing its own ship line through the Panama Canal.

The tractor school of Los Angeles County will be held at Covina in the high school shops January 16-21. Enrollment is limited to 60, enrollment fee $2. Apply to farm adviser, Los Angeles.

Planting of cabbage in southern district of California for 1922 is estimated by the U. S. bureau of markets at 5,227 acres against 5,724 in 1921 and 7,410 in 1920. The yield in 1921 was seven tons to the acre.

The Littlerock-Palmdale center of the Los Angeles County farm bureau is investigating plans for building a cold storage pre-cooling and icing plant at Palmdale to handle the pear crop of the valley.

The Coast and General

Colorado last year shipped 3,552 carloads of late grown cabbage.

Drying winds in Arizona have somewhat damaged range grasses.

An extensive road building plan is reported under way in Arizona.

New York is the largest producer of late cabbage of the states in the Union, shipping in 1921, 10,458 carloads.

Growers are receiving $19 and $20 a ton for rutabagas in the Outlook district of Yakima County, Washington.

About half the apples produced in Australia are grown in Tasmania. Tasmania was the pioneer in apple exporting.

Arizona shippers have disposed of considerable quantities of light amber honey at $7 per case or about six cents per pound.

Beginning January 1 all fruit entering Canada and grown in this country must be marked on the box, "Grown in U. S. A."

Sheepmen of Klamath County are waging bitter war against bobcats which have been slaughtering large numbers of sheep.

The Arcadia Citrus Growers Association, Florida, is reported to have taken $75,000 frost insurance policy on groves of members.

Malheur County, Oregon, won sweepstakes prize for the second time at the state corn show held at Portland during the Pacific International.

The Farmers Union has livestock commission markets at Omaha, St. Joseph and Sioux City. The three have handled this year 8,533 carloads of stock.

The Albany Creamery Association, Oregon, the largest cooperative creamery in this state, is now occupying its new plant built to replace the one burned last year.

The potato yield of Walla Walla County, Washington, is reported to be only one-fourth of normal; some authorities say because of not using properly ripened seed.

Reports from Australia indicate rapid growth of cooperative marketing associations among farmers. One of the most active of these is the Citrus Fruit Growers Association.

Cold nights in the Salt River Valley of Arizona have been favorable for lettuce and heads are reported to be solid and of excellent quality; shipment of carload lots began last week.

The annual meeting of the National Grange at Portland went on record as giving its support in every way to cooperative marketing, especially pledging support of the Capper-Tincher bill.

At the recent Pacific Northwest Fruit Exposition at Seattle it was determined to make it an annual event. A board of trustees was elected representing Washington, Oregon, Idaho and Montana.

Secretary Myers of the National Farmers Cooperative Grain Marketing Company says that 25 state farmers' organizations in 11 states have taken active steps to further the grain company's success.

Apple growers of Wenatchee, Washington, in conference at Spokane, December 15, are reported ready to put up a fight to abolish state inspection. Principal objection seems to be because of incompetent inspectors.

History of the Great Southwest in the Making

Editorial Correspondence

REPRESENTATIVES of the seven southwestern states of the Union are in Riverside. They are making history. These representatives or delegates come without power to DO anything. Just voices crying for the ending of the wilderness and using forces of nature which are now wasting—and destroying as they waste—to make possible the building of homes for men and women and little kiddies.

Doing will, however, result from the presentation of facts through the addresses, the discussions, resolutions and the spirit of cooperation. Better than all is the educational side. This convention or congress, or whatever it may be called, is bringing together such a fund of information as to the wonderful resources of this great Southwest that one cannot help but say: "We have not yet begun to realize the opportunity offered by the Colorado."

It is said: "The Colorado will irrigate six millions of acres, but as yet there are only two millions of acres reclaimed!" "The Colorado now discharges 13 million acre feet of water annually into the Gulf of California!" "Horsepower—millions—wasted every year!"

"Why don't we stop it?" "Haven't we the engineering ability?" Yes. "Haven't we the financial ability?" Yes, oceans of it. "Has not nature made wonderful provision for possible storage and control?" Yes. "Are there rich lands on which to pour the water?" Yes.

Then, Why!

Nothing is easier. Simply a lack of

C-O-O-P-E-R-A-T-I-O-N.

And the effort was made to start this convention off with a truly cooperative spirit but before the end of the first day cooperation got an awful jolt.

Seven states or portions of them are within the boundaries of the Colorado watershed, as is the Republic of Mexico. Each realizes as never before the necessity for claiming all possible rights to the water and to the power. So notwithstanding the appeal by those making welcoming speeches, by the president in his annual address, by the engineers of the geological survey, for harmony and cooperation, because in the abundance of wealth there is sufficient for all, yet the green-eyed monster appeared, and we who like a scrap leaned back in our chairs and had a real nice time.

Colorado opened the ball. She suggested that "before you folks build your great structure you'd better see that your title is good." Then followed an extended treatise on states' rights. Before there was a federal government there were sovereign states. The federal government is the creature of these sovereign states and these states may not be deprived of any of their powers or rights by act of the government.

Five other states joined Colorado in its desire for state management. California insisted that such divided management of the entire water shed, power and irrigation possibilities would simply result in chaos and everlasting contention. For 11 years already Montana and Colorado have been fighting in the courts each to secure its own rights. A third presentation is ultimately to be made before the supreme court, hence the various states all appealed for more complete cooperation at the beginning, yet each insisted that all others should "cooperate" with it. Even the California delegation was not a unit for it was divided between cooperators and the large private or rather public utility interests. The public utilities found it wise to unite with the delegates of Arizona, New Mexico, Colorado, Utah, Nevada, Wyoming, and against that portion of California's delegation which believed in the entire Colorado river basin control being under the reclamation service of the department of the interior, distributing to the various states, municipalities or hydro-electric irrigation interests as would be entirely just to all sections.

The first day of the convention closed with everybody under tension and a break apparently impossible to avoid. The six states insisted that the section of the constitution of the league which provides that only contributing members shall vote be set aside and that they be extended the courtesy of one vote only for each state because of their coming great distances and because of the lighter attendance of delegates. In other words, seven votes in the entire congress. Chairman von KleinSmid ruled that he was helpless to grant this request excepting by practically unanimous consent. Hundreds of California delegates had come to fight for California's interests and state control was not their idea of securing its interests. Diversity of opinion, diversity of methods advocated and need of immediate action to save the Imperial Valley was urged against compliance. The six states, however, insisted upon their plan and squarely stated that they would refuse to participate in voting unless they were granted the unit rule. California's universal courtesy was appealed to and this placed California delegates in an exceedingly delicate position. But with interests of such magnitude at stake, and with the appeal to the other states to unite under federal direction, California stood firm for federal action, endorsement for which she knew could not be secured under the unit ruling.

However, this decision of the Californians was only reached after a session of the delegates of that state which extended far into the night. The public utilities, or the privately owned hydroelectric interests, proved they were strongly intrenched, and willingness of the delegates of the other states to unite with private interests was a bitter disappointment to many. With Colorado and Utah as leaders an immense amount of time was killed in discussion of states rights in the abstract, states ownership of streams, or at least of the beds and banks of the streams, and states rights theories and propaganda since Colonial days, likewise decisions of supreme courts since long before Civil War days were all brought to bear upon the question. Californians made no answer whatever, simply standing square in their demand for government direction in the entire Colorado river basin development.

On the second day Secretary Fall of the department of the interior, and present with a direct message from President Harding, gave force to California's contention that government direction should prevail. Secretary Fall made several declarations which aided in clearing the atmosphere. One of these was in effect that a certain copy of an alleged contract between the department of the interior and the city of Los Angeles, which had been referred to on the floor, had not been signed by the department, and Los Angeles also stated that no such contract had ever been signed by the city of Los Angeles. However, this statement gave to the private interests and to the other states encouragement in that some construed it as a promise that no contract would be signed with the city of Los Angeles. But one statement made by the secretary was in effect: "When the time does come when we have determined as to what the equitable rights of the states are, the development of power, conservation of water for irrigation and flood control in a great comprehensive scheme covering the entire Colorado river basin will be taken up and should under no circumstances be under any direction other than the federal government." For many this was the first time any such declaration on the part of a government official had ever been heard, and it electrified and brought to his feet practically every attendant at the convention and there was prolonged cheering.

One event equally as thrilling as the reception tendered Secretary Fall was that which was given to Honorable R. T. Jeffery, chief engineer hydroelectric power commission of Ontario, Canada. Statements made by believers in public controlled hydroelectric power and denied by public utility people regarding the success of the work of the hydroelectrical commission of Ontario have made it imperative that the truth of the stiuation be known. One of the wise acts of the management of this great convention of the League was in securing the attendance of Hon. Mr. Jeffery. He made fullest statement and explanation of the situation in Ontario. Under private ownership almost prohibitive rates had prevailed. The province entered the field and, usually through agreement mutually satisfactory, acquired at Niagara Falls and other points great hydroelectric plants already in operation. Distribution is secured through agreement with municipalities, great industries or sometimes with individuals, but always at cost. Mr. Jeffery insisted that "cost" means cost. That is, entire fairness with the people and fairness of the province with itself demanded accurate accounting or auditing of every feature including interest, depreciation, and all overhead, and that the low rate secured to the people was not in any sense because of funds secured through taxation being transferred to the expense fund of the hydroelectric. But we will quote at some other time more fully from Mr. Jefferey's address. The closing of his address brought the entire audience to its feet in one prolonged cheer and heartiest expression of appreciation for his coming more than 3,000 miles to explain to California cooperators the work of his province. He insisted that Ontario's success had been secured only through cooperation.

RIGHT OF FARMERS TO A FAIR RETURN

It is rather shocking to be told, and to have the statement strongly supported, that 9,000,000 bales of cotton raised on American plantations in a given year actually will be worth more to the producers than 13,000,000 bales would have been. Equally shocking is the statement that 700,000,000 bushels of wheat raised by American farmers, would bring them more money than 1,000,000,000 bushels. Yet these are not exaggerated statements. In a world where there are tens of millions who need food and clothing, which they cannot get, such a condition is sure to indict the social system which makes it possible.

In the main, the remedy lies in distribution and marketing. Every proper encouragement should be given to the cooperative marketing programs. These have proved very helpful to the cooperating communities in Europe. In Russia, the cooperative community has become a recognized bulwark of law and order and saved individualism from engulfment in social paralysis. Ultimately they will be accredited with the salvation of the Russian state.

There is the appeal for this experiment. Why not try it? None challenges the right of the farmer to a larger share of the consumers' pay for his product, no one can dispute that we cannot live without the farmer. He is justified in rebelling against the transportation cost. Given a fair return for his labor, he will have less occasion to appeal for financial aid, and given assurance that his labors shall not be in vain, we reassure all the people of a production sufficient to meet our national requirement and guard against disaster.

The base of the pyramid of civilization which rests upon the soil is shrinking through the drift of population from farm to city. For a generation we have been expressing more or less concern about this tendency. Economists have warned and statesmen have deplored. We thought for a time that modern conveniences and the more intimate contact would halt the movement, but it has gone steadily on. Perhaps only grim necessity will correct it, but we ought to find a less drastic remedy.

The existing scheme of adjusting freight rates has been favoring the basing points, until industries are attracted to some centers and repelled from others. A great volume of uneconomic and wasteful transportation has attended, and the cost increased accordingly. The grain milling and meat packing industries afford ample illustration and the attending concentration is readily apparent. The menaces in concentration are not limited to the retarding influences on agriculture. Manifestly the conditions and terms of railway transportation ought not be permitted to increase the undesirable tendency. We have a just pride in our great cities, but we shall find a greater pride in the nation which has a larger distribution of its population into the country where comparatively self-sufficient smaller communities may blend agricultural and manufacturing interests in harmonious helpfulness and enhanced good fortune. Such a movement contemplates no destruction of things wrought, of investments made, or wealth involved. It only looks to a general policy of transportation, of distributed industry, and of highway construction, to encourage the spread of our population and restore the proper balance between city and country. The problem may well have your earnest attention.—From President Harding's Message to Congress.

Saturday morning's session was opened by Congressman Phil D. Swing of Arizona in urgent appeal to all states of the Southwest to get together in support of federal handling of the entire project. "It is time for the states to drop their mutual distrusts," he said, "now at the time when the nations of the world are getting together to clear up their mutual distrusts." He quoted Secretary Hoover, now definitely announced as a member of the Interstate Colorado River Commission, as saying that the project can only be developed under federal control on a comprehensive plan for the benefit of all the states.

Further he urged that the need for development was immediate and would provide the boys of the American Legion opportunity to build up the reclaimed land, not for themselves alone, but for all of us. "We will have to reverse the trend to the cities or people will have less to eat and pay more for it. We will not be raiding the treasury for them, but giving them a chance to produce food."

Mayor Bartlett of Berkeley followed with facts proving economy and success of municipally managed utilities. Mayor Bartlett has been in the fight for many years. He knows the rules, he knows all the dodges of his opponents, and hits straight from the shoulder in perfectly businesslike and friendly style.

"Our problems of publicly managed enterprises can only be solved by careful and reasoned work; they can't be solved by sentiment. Publicly managed enterprises have been added to from time to time as the needs of the people and their growth made it imperative. Many things now universally accepted were once bitterly questioned; new ones will come in turn. When I was a boy in Alameda our house was drained into a cesspool; now into municipally managed sewers; so it will be with water supply, with power and light." "Berkeley buys its water from private companies. Since the beginning of the war we have had three raises in water rates and the company is asking the railroad commission for a fourth. This in face of the fact that municipally owned water systems practically unanimously have kept pre-war rates."

In speaking of the proposed California Water and Power Act, he said it was not put under the railroad commission because its chief duty was to fix rates, whereas the rates of municipal projects are automatically fixed—at cost.

Municipalities can build projects more cheaply than private companies because on their security they can borrow at half the interest rates which private companies must pay. They can operate at half the cost because the overhead in salaries is practically cut in two. For instance, the president of the Pacific Gas and Electric receives $30,000; Mr. Mulholland, in charge of the water and power department of Los Angeles, gets $15,000. These facts, he added, were supplied by the railroad commission, not by the corporations. Another cause of high charges by privately owned utilities was the maintenance of a huge surplus. He understood that one such concern was forced by the railroad commission to cut the salary of its president from about $58,000 to about $30,000—but the railroad commission can't stop the company taking that lopped off $28,000 from its surplus fund.

In closing he said the same principles and facts apply in a larger way to the development of the great Colorado basin project. "We must cooperate and cooperate in accordance with a well considered plan. We want the Colorado developed, and only one agency can develop it, and that is the federal government. When the government has built the dam, then we will have our local machinery ready to receive and carry and distribute the water and the power within our own states to our own people, the government forever maintaining control and distributing according to the rights and needs of the several states. "The great Southwest should stand together and develop as a whole, and we want to do our share in making that possible."

Mr. Mulholland, chief engineer of the Los Angeles bureau of power and light, was greeted with long and hearty applause, the audience, almost to a man, rising in spontaneous tribute to his ability and accomplishment.

He expressed his deep satisfaction, as had Chief Electrical Engineer Scattergood, preceding him, in the statement by Secretary Fall of the purpose of the government to investigate fully and keep in its own hands the development of the Colorado. Also he especially called attention to the urgent need of a dam on the Colorado to save the people at its mouth from destruction. "The Colorado is a great writhing snake and if its energies are released has tremendous power of destruction; controlled, it will give valuable service. This power we must preserve in public ownership. We cannot tolerate that the stocks that control it should be owned in Paris or London or anywhere else; it must be held for us and for our children for all time."

The declaration of Secretary Fall was a bombshell; its explosion stirred up the dust, but the result was a wholesome and wholesale clearing of the atmosphere. Proponents of public ownership in California felt that the whole proposition had been placed on solid foundation and were ready to drop discussion and go home or to San Diego to attend the formal hearing by the secretary—the matter was in hands more competent than theirs, in fact, just where it belonged.

Representatives of the power companies were not so happy; neither, it appeared, were the delegations from the other states, for they apparently had come from their homes under great fear of the grabbing propensities of Los Angeles. They, no doubt, will soon realize that their rights are secure in the hands of the federal government. That at least is the confident hope of the public ownership people.

The meeting was abruptly adjourned at 3 o'clock without presentation of resolutions which, it was said, had been carefully prepared by the power companies and some of the delegates from the six dissenting states. The public ownership people, who were responsible for the adjournment, felt that the opposition was "trying to slip one over" in a statement which, while apparently only urging speedy and comprehensive development of the Colorado, was in reality endorsement of private development.

CONVENTION NOTES

Somebody did one big job in working up an interest in this convention of the League of the Southwest. The general impression seemed to be that Arnold Kruckman, secretary and all around hard worker, got into the traces with a corps of workers and made plans which were most successful in securing a great attendance. Every state of the Southwest was represented.

* * *

Chairman von KleinSmid makes an ideal presiding officer. He is quick and just in his decisions and has a sense of humor which saves the day when the tension is close to the breaking point.

* * *

"You are representatives of the seven best states of the Union and you should show by your ability to cooperate in this biggest economic problem before the United States appreciation of the greatness of these Southwestern states." From the chairman's address.

* * *

There are 245,000 square miles within the boundaries of the Colorado river basin. Of all the freak problems before engineers none has ever equaled control of the Colorado. Not only does the great quantity of silt in its water complicate the situation, but its variation of discharge from a maximum of 200,000 second-feet down to a minimum of 3,000 creates an unparalleled situation.

* * *

In addition there are the more or less conflicting interests of seven states and two nations at stake. It will be many years before we will have all the problems settled to the satisfaction of us all.

* * *

One of the speakers told us how many millions of horse power were going to waste every year, never to be recovered. We are not sure, perhaps it was six or seven million. But in any case it was enough that it should impel intelligent people to secure its use as soon as possible. It is self evident that that use will not be secured save through cooperation.

* * *

Seasonal equalization can only be secured through storage.

* * *

Meetings were held in the Polytechnic high school, and about the only complaint was in effect that the chairs were not made for real men. However, they were fairly comfortable. The ventilation was good and acoustics satisfactory, and the boys made excellent ushers. The cafeteria of the school was available to all.

* * *

The Mission Inn was headquarters, and the Miller family and the assistants at the hotel could not have done more for the comfort of their guests.

MACHINERY MODERNIZES FARMS

More than ever farmers are turning to invention and science to do heavy work of the farm. Machinery that is being used by progressive farmers everywhere has paid for itself many times over in time and labor saved and results achieved.

The cost of this machinery is relatively small. Most of the heavy, hard work of the farm can be done by machines. Agriculture is one of the five basic industries of the country and should keep pace with the progress of invention. The farmer is as much a business man as the commercial and industrial leaders in the cities and in many cases is more vital to the economic life.

The fruit and agricultural bureau of the Sacramento chamber of commerce is making definite effort to work with the farm bureau.

Branch Office and Warehouse: Stockton, Calif.

Orange County Citrus Institute

THE third annual Orange County citrus institute, under the joint auspices of the university extension service and the county farm bureau, was held at Santa Ana, December 8-9, the farm bureau president, W. M. Belding, presiding. Mayor John Mitchell of Santa Ana welcomed the delegates, the glee club sang, and thus was the program launched.

The first paper was on the cost of production of oranges and lemons, illustrated with charts, by F. C. Wallschlaeger, secretary California Citrus League. The next, and one that occasioned much interest, was on the saving to the growers through water transportation over rail shipment, by A. E. Bennett, second vice-president California Fruit Growers Exchange. This we append. The influence of foreign plantings was sketched by Bruce McDaniel, and Farm Adviser Wahlberg outlined a plan of work for a citrus department of his office.

In the afternoon, after some instrumental music, came more vocal numbers beginning with one on "Meeting Increased Production in Citrus," by P. S. Armstrong, California Fruit Growers Exchange, after which Francis Cuttle gave a talk on maintaining and augmenting the irrigation water supply of the Santa Ana Valley, a matter of which he has made a long and deep study. The next was a frost paper which was, however, warmly received, by Floyd D. Young, meteorologist of the United States weather bureau, which closed the first day's program.

The Second Day

More music, followed by the odorous subject of "Fertilizers," by Dr. W. P. Kelley, chemist of the citrus experiment station; then a paper by Doctors Barrett and Fawcett of the citrus experiment station, on the menace of root diseases to citrus trees. After lunch orchestral music and a vocal solo tuned the ear of the audience to receive a report on citrus pest control by Harry S. Smith, in charge of pest control, state department of agriculture. R. S. Woglum, the well known entomologist, told of the present status of citrus pest control in Southern California. E. M. Utt and D. Eyman Huff reported on progress looking to the establishment of a county insectary. J. D. Culbertson, of the Limoneira Co., Santa Paula, had a paper on stability of labor on the ranch. The same problem in the packing house was treated by C. L. Crumline of the La Habra citrus association, and the economy of permanent labor was argued by C. V. Newman, manager San Joaquin Fruit Co. The institute closed with "Sanitary Housing" by Dr. Chas. L. Bennett, of San Dimas.

* * *

WATER TRANSPORTATION FOR CALIFORNIA CITRUS PRODUCTS

By A. E. Bennett

Ever since the birth of commerce transportation has been its twin brother. Early in the history and traditions of mankind we read of the ships of the sea and the ships of the desert. Noah was the first ship builder on record, and even to this day designers have not been able to improve on the lines and proportions of the ship which he built. And never since that time has any ship been called upon to carry so promiscuous a cargo.

Great advances, however, have been made in caring for the cargo and in the speed of ships. Up to the time steam power was discovered and applied to the means of transportation, commerce was meager and developed very slowly. Even as late as our grandfathers' time there was little barter and sale, compared with our day. They were their own spinners and weavers, shoemakers, cabinet makers, bakers, butchers, candlestick makers, and so forth. Each family was sufficient unto itself, unless it went in for the luxuries of the day.

When, however, in the course of the evolution of time mechanical power was applied to the vehicles of transportation commerce grew by leaps and bounds. Today a family of average means in Southern California has access to the products from the four corners of the earth. Almost daily they call upon their merchants for the spices of India, the teas and silks of the Orient, the fruits of Hawaii, the hardwoods of the Phillipines, the textiles, glass and porcelain of Holland, Belgium and France, the chemicals of Germany, furs of the extreme North, fruits of the Tropics, coffee of Brazil, cereals of the Middle West, and meat products from our mountain ranges and South America.

In our day commerce has grown to tremendous proportions, so that transportation has become a great problem. The main economic problems as I see them are just three in number—production, transportation and distribution.

When it comes to production of vegetables, fruits and nuts California is the marvel of the world in the tonnage produced per acre and in the high standard and excellence of the products. There is hardly a fruit known to commerce but that somewhere within our borders is being produced in abundance and of the very best standards. Apparently the only limit in volume of most fruits and vegetables is a profitable market.

With regard to distribution, that problem is being solved by our many splendid growers' cooperative associations, with the California Fruit Growers Exchange setting the pace, having in the year just closed shipped 43,592 carloads, or 72½ per cent of the citrus shipments from the state, giving an even seasonal distribution, and also an equitable distribution to all markets.

I think that we may claim with perfect candor and honesty that we of California are a long way on the road to solving the problems of production and distribution. But transportation is a different matter. Never in the history of the fruit industry of California have freight rates and railroad service cost so much. In fact, they stand today at about 100 per cent above normal. We have here products that have to find markets averaging 2500 miles or more from the point of production.

Up to the present time the growers have not seen their way clear to help themselves in this matter and are at the mercy of the interests controling the railroads. A new deal seems to be on the boards. Today we stand at the parting of the ways. A combination of circumstances of large dimensions has united to make it possible for citrus growers to help themselves in this very vital matter. I will mention three or four of them:

First—Following the close of the Great War our government finds itself in possession of many ships which it must get into service. Among these are a number that are admirably adaptable to the fruit business; just the right size for economy of operation, and the best of lines for speed, with a surplus of power for refrigeration.

Second—Government officials having to do with these ships have a sympathetic understanding of our problems and are desirous of alloting some of these boats to us.

Third—Railroad freight rates are and have been so high, and railroad executives have shown so little interest in our problems that the growers' determination to help themselves has been aroused.

Fourth—The condition of the industry from an organization standpoint is such that the growers are now able to come to their own assistance.

In water transportation expensive rights of way do not have to be purchased; road beds do not have to be built and maintained; heavy mountain grades do not have to be negotiated, nor burning deserts crossed. The cargo will not be exposed to sudden changes of temperature. The shipper will not receive inspection reports reading: "Frozen in transit," or "In a heated condition caused by improper ventilation." These conditions will by up-to-date equipment be at all times under the control of the ship's crew.

(Continued on Page 630.)

60300 Gallons of water per minute

When the Salt River Valley Water Users' Association decided to reclaim more than a hundred thousand acres of land in Arizona they standardized upon Layne & Bowler Turbine Centrifugal Pumps. To date 52 of our pumps are in operation in that famous project and 20 more are being installed. The present production is 60,300 gallons per minute and the pumps are running night and day—over 80 million gallons every day.

This is but one of many immense projects where Layne & Bowler Pumps are assisting the land owners. The same careful service our Water Engineers give to the largest projects is available to the purchaser of a single pump. We can make immediate deliveries of pumps to early purchasers.

Layne & Bowler Corporation

Layne & Bowler Turbine Centrifugal Pumps

Legal Queries

Louis B. Stanton, attorney, 343 Wilcox Building, Los Angeles, will answer legal queries in this department.
Immediate mail replies cannot be given except where fee to Mr. Stanton is paid. When replies are wished in Cultivator address query to 317 Central Ave., Los Angeles.

Correspondence School Contract

I signed contract for correspondence school course. About a week thereafter found I could not proceed with it and notified school that I would forfeit the deposit. The school now insists upon full payment. Can they enforce such payment?—Subscriber, Lankershim.

It would depend entirely upon the form of contract as to whether it could be enforced. Generally speaking, as long as one party offers to perform, he is entitled to receive the full account for which the contract was made. In other words, a party cannot cease to operate under a contract at his pleasure.

Selling Water

I do not wish to become a public utility but I wish to supply my neighbors with water for hire. Can this be done and is the agreement sent in sufficient for that purpose?—Subscriber, Hollister.

You should take any such matter up with your local attorney, as it may be possible that some arrangement may be made whereby you may be absolved from subjection to the railroad commission. Generally speakking, however, a public utility is defined as any person or corporation who performs service for or delivers commodities to the public or any portion thereof. This last phrase is defined as the public generally or any portion of the public, including any person or private corporation or subdivision of the state for which the service is performed or delivered. The agreement attached hardly amounts to anything in that it specifies no term during which the water will be delivered, manner in which it will be delivered, or price for which it will be delivered.

Veteran's Aid

I enlisted in the service from New York. Since the war, I have taken up my residence in California. Can I take advantage of the California loan act?—Subscriber, Walnut Grove.

The California act specifically provides that those persons who are entitled to its benefits are only those who were at the time of their enlistment, induction or drafting bona fide residents of California. It would be possible that you might be able to take advantage of any act which was passed in New York.

Building Owned by Tenant

How can a tenant place a building upon rented land and be entitled to remove it when he vacates the land?—Subscriber, Adelaide.

The general law concerning fixtures prescribes that a tenant may remove from the demised premises at any time during the continuance of his term anything affixed thereto for the purpose of trade, manufacture, ornament, or domestic use, if the removal can be effected without injury to the premises, unless the thing has by the manner in which it is affixed become an integral part of the premises. It is further provided that when a person fixes to the land of another, without receiving permission from the owner to remove the thing placed, it belongs to the owner of the land. It is quite apparent under these provisions that where such a thing as a house is concerned, it would be necessary to procure an agreement from the owner of the land in order to permit you to remove it.

Homestead

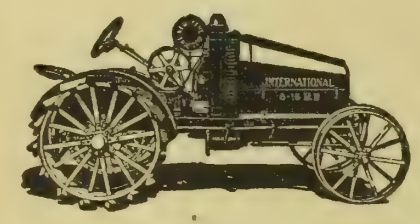
A wife bought a house and lot with her separate funds and later homesteaded the property. Does the husband succeed to this property or can the wife's son by a former marriage claim a part?—Subscriber, Mendocino.

If the homestead selected by the husband and wife or either of them during their coverture and recorded while both were living is selected from the separate property of the person selecting or joining in the selection, it vests absolutely in the survivor. If it was selected from the separate property of either without his or her consent, it vests in the person from whose property it was selected and in his or her heirs or devisees, subject to the power of the superior court to assign it for a limited period to the family of the decedent.

Books Not as Represented

My wife gave a book agent a subscription. The books have been delivered and the subscription was on the installment plan. Some of the leaves were loose. The book is undesirable and I desire to return it. Can I be held liable for the full amount?—Subscriber, Santee.

If the books were defective or not as represented, your wife is certainly entitled to rescind the contract, return the books and demand return of moneys paid. Any action on the contract could be defended on the ground of misrepresentation. As you did not sign the contract and as books are not necessaries of life, you certainly could not be held for the amount.



The
International 8-16 Tractor Is Ideal Power for Plowing
(Combine With It a P&O Plow)

IN THOSE states where International 8-16 Tractors have been well known for several seasons they need no introduction. New owners are buying on the recommendation of old users, and on thousands of farms the popular 8-16 may be seen working efficiently, converting cheap kerosene into economical farm power.

If yours is new country for the International 8-16, let the International Dealer show you this adaptable small tractor. You will find it most efficient, economical power for plowing. In addition, an International 8-16 Tractor will render you satisfactory service, at belt and at drawbar, from January to December.

The International 8-16 because of its light weight, snug compactness, ease of control, generous reserve power above its rating for emergency pulls, three speeds forward, economical operation and general fitness for diversified service, is highly popular with farmers in every branch of agriculture.

Remember that the ***International 8-16 Tractor now sells for $900*** — the lowest figure at which this tractor has ever sold. The new price includes all the necessary equipment — platform, fenders, governor, belt pulley, etc. If you require larger power, keep in mind that the famous ***Titan 10-20 Tractor now sells for $900,*** and that the ***International 15-30 Tractor has been reduced to $1,750*** — both selling at the lowest price at which they have ever been sold. All prices are f. o. b. Chicago. These prices certainly justify immediate tractor investment. See our dealer for full information as to deliveries and terms.

Queries Answered

Questions to be answered in this department should be received at the office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Budding and Grafting

Will you please inform me the proper time of year to bud citrus trees and the best time to graft the mulberry tree? What time is best to prune the loquat?—Subscriber, San Ysidro.

It is now late for fall budding of citrus trees, and it will be best to wait until the first of June and put in buds which will grow at once. Mulberries are best worked in early spring, varying a little with the seasons, but the first of February is about the time. Loquats scarcely need pruning and it is seldom done. The best time is immediately after crop is ripe. What little is needed, generally, may be done at any time, even now, though trees are in bloom.

Water Rates

What is a fair rate for water for irrigation purposes in Orange County? We are paying 70 cents per hour per 100 miners inches. How may we know we are receiving full measure? So far as we know the water has never been measured.—Subscriber, Orange County.

If the cost, including attendance, is 60 cents per hour for pumping 100 miners inches which has been delivered for $1 an hour at the well should be increased by the power cost advancing 25 per cent, either because of higher charges or lower water level, the same amount should be added to the delivery price, which in this case would be 15 per cent, or $1.15 per hour for the water. The difference between 60 cents and $1 per hour will not amount to more than enough to re-

place the wear of machinery and the repairs to well pit in the term of ten years, since the depreciation of pumping machinery, other than motors, is about 25 cents per hour on a plant with 100 inches capacity.

There are many kinds of measuring weirs that are exact, but they require an expert to place them properly. A weir that will be approximately correct can be made by cutting a notch in a board five inches deep and long enough to let all the water pass through. Place this in the ditch where the water has a clear drop away from the lower side but will move slowly above the weir. Drive a stake in the bottom of the ditch about two feet upstream from the weir and so the top of the stake will be level with the bottom of the notch. Then have a slide to close the notch until the running water stands five inches above the top of the stake when all is running through. There will then be five miners inches (ordinary usage) passing for every inch of width of the open gate. If the water is in an open cement ditch the cross section of the space occupied by the water can be measured and the velocity of the flow obtained by timing a float, which should be weighted so as to stand upright in the water. In this way the amount of water passing a point in a minute can be determined. The ditch should be well cleaned before beginning the measurements and a deduction of ten per cent made from the result obtained, because of obstructions on sides and bottom of the ditch, unless it is very smooth, when a less deduction should be made.—J. B. N.

Black Monukka

Can you direct me to a Black Monukka vineyard? I would like to see the vines growing.—Subscriber, Modesto.

There are no commercial vineyards of Black Monukka grapes in California at the present time with the exception of some small acreages in the Imperial Valley. The other plantings of this variety are individual vines scattered here and there. A few vines are growing in the government experiment vineyard near Fresno.—F. K. H.

Spraying Cabbage

I put cabbage plants in about a week ago. They are doing fine, have all set. How soon should they be sprayed and what would be a good solution?—Subscriber, Covina.

At this season the cabbage aphis have about ceased their labors and will soon be gone. If they should bother a nicotine spray, dry or in solution, should be used, with a slight preference for the dust spray.

Alicante Bouschet Cuttings

Could you explain in your next issue how to prepare Alicante Bouschet cuttings—what length they should be cut before planting for rooted vines, and how they should be handled?—Subscriber, Fair Oaks.

Alicante Bouschet cuttings are made the same as any other grape cutting. They should be 14 or 16 inches in length with the cut at the bottom immediately below the joint and cut at the top at least an inch above the joint. Not more than two cuttings should be made from the cane since the wood near the base is the best for this purpose. After making, the cuttings should be tied loosely in bundles and buried in fairly sandy, well drained soil, preferably with the butt ends up. The soil in which they are buried should be kept moist, but not too wet; until planting time. Frequent examination will indicate the condition of the cuttings throughout this period.—F. K. H.

Dividing Asparagus

I would like to know if dividing up old asparagus crowns is as good as getting new roots.—Subscriber, Newman.

Unless old stock has deteriorated and is considered poor, its division would produce as good stock as any. Old stock so divided generally improves over past condition if roots have not been divided for some years.

Alfalfa for Fertilizer

Reading in the Cultivator of November 26 your "Substitute for Manure" question and answer, I would like you to tell the Ontario subscriber to buy a bale of good alfalfa hay and break or grind it up as fine as possible and dig it deep into his 500 square feet of garden. I am not sure, but think a sack of alfalfa meal would be fine and just the thing. The next best is bean straw. I get this from the farm bureau, which recommends alfalfa hay as the best substitute for stable manure. Tell your subscriber also for me to join the farm bureau unless he is already awake.—Wm. W. Kent, Valyermo.

BEEKEEPERS' SCHOOL

The college of agriculture, University of California, held a six day course in advanced beekeeping for commercial beekeepers at Exposition Park, Los Angeles, December 5-10. Both registration for the course and attendance were fair.

Geo. A. Coleman, instructor in entomology at Berkeley, has been acting as secretary and enrollment clerk and proves a good rustler. The instructional staff consists of specialists from the United States department of agriculture, state college of agriculture, members of the state beekeepers' association and practical apiarists from various parts of California. Added to these are a few experts in kindred lines from outside the state, lecturers on native honey plants, in fact information is given on every subject that could interest a practical beekeeper. The meetings were held in the auditorium of the state exposition building.

FARM BUREAU'S SECOND YEAR

The Farm Bureau Federation is mailing to county farm bureaus an official review of the activities of the American Farm Bureau Federation from January 1, 1921, to November 1. It is a gathering of facts regarding federation during the ten months and a look forward to the coming year's work. It is filled with tables giving information as to more intimate activities of the federation and gives special attention to the agricultural bloc and its accomplishments.

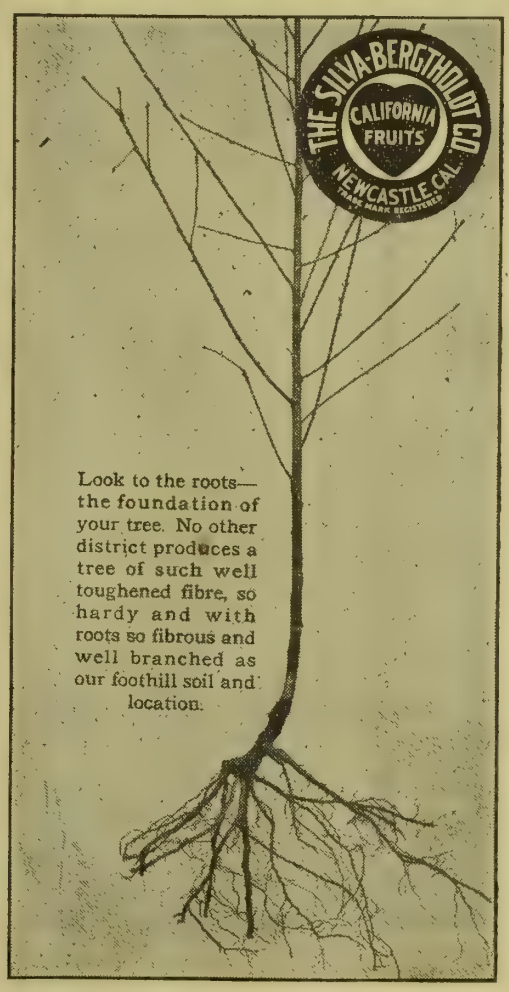
THE FARM WOODLOT

There should be set aside upon every farm a small area for a home woodlot. The trees planted there could later be thinned and the trees withdrawn used for fence rails, posts, etc. While those left standing were growing to maturity they would form a fine shaded playground or a family or neighborhood picnic ground. At some future time the timber would doubtless prove valuable, as many species, easily procured, yield lumber of high ornamental value. Through all its growing years the woodlot could be a shelter and a windbreak protecting residence, outbuildings, or stockyards.

AFTER THE ACCIDENT

In case your car is involved in a smash-up get these facts down on paper just as soon after the accident as possible: Name, sex and address of injured persons, driver and witnesses, license numbers of other cars, exact location, date and time of day, weather and street conditions, circumstances and blame, and make pencil sketch showing details. Stay on the ground and talk only to your attorney. This is the advice of the National Safety Council.

Plant an Orchard



Look to the roots—the foundation of your tree. No other district produces a tree of such well toughened fibre, so hardy and with roots so fibrous and well branched as our foothill soil and location.

Write us for complete copies of the announcements of the "Bergtholdt Plan." This plan is a vital issue to every fruit grower—to all California. It means your success and ours in fruit growing. The responsibility for this plan is upon every individual fruit grower — boost for it.

Growing fruit is the best paying business in California.

The acid test of any business is not what it will do under favorable conditions, but what it will do under adverse conditions.

Even under this year's depreciated values, the orchardist with a block of **Prunes, Bartlett Pears, Apricots, Cherries, Raisins, Shipping Grapes, Clingstone Peaches, Drying Peaches, Fall Pears, Almonds, Shipping Peaches, Shipping Plums, Canning Plums,** and **Figs** will make more money than the grower of grain, hay, alfalfa, beans, rice or the dairyman.

Every acre of land adapted to fruit growing that you now employ in growing grain, hay and other crops, is too valuable for fruit to be employed as you are now doing.

Every year that you grow these other crops instead of planting your acreage to orchard, represents not only a dead loss in money, but more than that, one year's loss of life's opportunities.

The trees you plant now will, five or six years hence, assure your share in the profits inherent to the California fruit grower.

We offer for your planting the most complete assortment of commercial fruit varieties.

Our trees are the best that care in propagation and efficient workmanship can produce.

Our catalogue, full of accurate practical horticultural information and suggestions, and our thirty years' experience in fruit growing, and fruit marketing, are at your service for the asking.

Submit us a list of your tree wants for quotation while the varieties you desire are still available in our foothill grown stock.

Write me today.

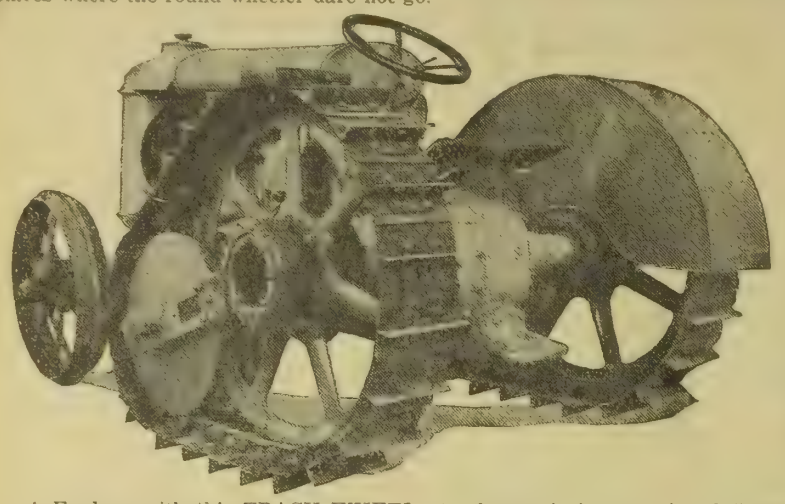
Make a TRACK-LAYER of Your FORDSON, SAMSON or Other Small Round Wheel Tractor

that you may have and increase the pulling power 50 to 100 per cent. or even better in some places.

Six hundred square inches of ground bearing surface enables the tractor to negotiate soft and sandy soil, climb steep hills, and go pulling its load over places where the round wheeler dare not go.



A Fordson with this TRACK WHEEL attachment is in operation daily at Davis and you are invited to see it any day.

Those attending the TRACTOR COURSE at the University Farm School on Jan. 2-7 will have an opportunity to witness its performance.

An official test has been made by Professor L. J. Fletcher, a copy of which is at your disposal.

(Continued from Page 627.)

Water transportation always has been, is now and always will be, the cheapest method of transportation, as has been so definitely proven on the Great Lakes where freight is loaded, transported and unloaded at the cheapest cost per ton of probably any place in the world. This fact has transformed Detroit from a most beautiful residential city to a noisy, dirty, smoky, throbbing industrial city, the center of the auto industry. Freight rates make and unmake industries. This is no new thing under the sun; it has ever been so.

Our investigations in the East indicate that we cannot expect any of the established coast to coast steamship lines to furnish a refrigerated fruit service for us, for the following reasons:

The oldest and strongest steamship companies now operating are dominated by railroad influence through capital sources and will not compete.

Those steamship lines not dominated by railroad influence are operating U. S. shipping board ships and have not the capital required to install a sufficient amount of refrigerated space in the number of ships required to give the service.

Under the U. S. shipping laws a foreign built or owned ship cannot engage in coastwise business.

As soon as the new shipping board was organized we opened negotiations with it, having in mind the securing of ships especially adapted and fitted for service as fruit carriers, as well as carriers of other California products, and of products manufactured in the East and consumed in California.

After many weeks of negotiating we secured a tentative agreement with the shipping board by which it will permit us to select six of its ships for our service. It will install cold air refrigeration in about two-thirds of the space in the ships, and lease the ships to us at a very low rate on a "Bare Boat Charter," for five years with option to purchase, we to furnish crews and operate the ships.

The ships we desire are of 7500 dead weight tons, three decks—fine lines and 15 knots speed—refrigerated in two-thirds of their holds. Each ship would carry a maximum cargo of about 74,000 boxes, but we are estimating average cargoes of 60,000 boxes only, during months of January to October, both inclusive, leaving space in the ship for other cargo to the amount of about 3000 tons East bound.

On the return trip the ships would bring general cargo consisting of dry goods, boots and shoes, chemicals, light steel products, etc., for our local merchants and manufacturers. There is plenty of this cargo for all the ships now operating.

Notwithstanding high freight rates we shipped out of California during the past year November 1, 1920 to October 31, 1921, over 150,000 cars of perishable food products, deciduous fruits, citrus fruits, melons and vegetables, and about 20 per cent of these shipments went to the Atlantic seaboard. It is neither logical nor efficient that this tonnage, produced practically at tidewater on this coast and consumed at tidewater on the Atlantic coast, should be transported over deserts and mountains, facing floods, storms, and extremes of temperature, across the continent by rail, under very defective refrigeration, when it can be carried by water in good steamships under satisfactory refrigeration, in three or four days' additional time, at half the present cost.

Refrigeration by steamship would be maintained uniformly at any temperature desired, and humidity and ventilation would also be regulated. A good steamship will make a run from San Pedro to New York in 15 to 16 days. Therefore, we expect to land our fruit by steamship under proper refrigeration in better condition than the average rail shipment.

As to the quantity of fruit that could be landed in the markets in one cargo, we are assuming average cargoes of about 60,000 boxes, to be divided rateably between two ports—New York and Boston, or New York and Philadelphia. We frequently sell 25,000 to 30,000 boxes in New York auction market in one day and have sold as high as 40,000, so that you see that the average cargo would not supply the two markets more than two days. During the past summer there were sold in New York auction market on several occasions over 300 carloads of California fruits in one day.

Water transportation for fruits under proper refrigeration is not an experiment. The trail has already been blazed. The United Fruit Company has been in the business for years, transporting booth bananas and oranges, and it has developed a very high type of equipment for handling and refrigeration. Oranges are being brought to England from South Africa by refrigerated ships, through the tropics, after having made a 1,700 mile railroad journey from the point of production.

Transportation charges are the most serious burden that our growers now have to carry or ever have carried. Indeed, it is as great as all the other burdens added together. And it is a burden that is a first mortgage on our crops; yes, more than that, it is a first mortgage on all other resources which the grower may posses, for the railroads are not content to look to the returns on the fruit to pay the freight, but exact a good and sufficient and acceptable bond.

We have here a proposition where the grower has first to make an investment in land, then prepare it for irrigation, and bring water to it, purchase trees, set them out, nurse them along for six or seven years before any return worth mentioning comes back, and when the returns commence to come in the railroads talke half for a service upon which they take absolutely no chance in securing the return which they exact and in performance of which not more than an average of ten days' time is required. It is an uneconomic proposition under which no industry can permanently thrive. What is the answer? Providence has made a full and complete solution possible; nature has placed at our very door the means of the cheapest transportation ever developed.

We are not wondering whether this thing can be done. We know from the experience of others that it is entirely practical and possible. The necessary requirements are money, courage and good business sense. I think that it has been demonstrated that we have these qualities in good measure in our producers' cooperative organizations.

One of the drawbacks to shipping by water is that the shipper has the trouble and annoyance of delivering his freight to the steamship company's dock, paying the marine insurance, and in the case of citrus fruits there is the additional drawback that at times the fruit lies on the dock, subject to variations in temperature, for two or three days before the ship is ready to load.

The plan of the California Fruit Growers' Exchange provides that the Producers' Steamship Company shall render exactly the same service to the shipper as the railroads now furnish, viz., the steamship company shall send its trucks to take and receipt for the fruit at the door of the packing house of the shipper, transport it to San Pedro, place it in a pre-cooling plant at the dock, pre-cool the fruit at once, and hold it in cold storage and on the ship until unloaded at the markets in Philadelphia, New York and Boston.

This requires that the steamship company shall own and operate a fleet of trucks with bodies especially constructed for this service, with covers to protect the fruit from sun and rain.

The steamship company will own its dock at San Pedro, with a pre-cooling and storage plant thereon large enough to hold about 200 cars of fruit ready for loading when a ship arrives. In this plant we will install conveyors for taking the fruit from the trucks into the pre-cooling rooms, and from the rooms into the ship, so that the ship may be loaded as rapidly as practicable, and thus reduce to the minimum the delay of the ship in port.

It seems quite certain that fruit handled in this manner, viz., pre-cooled and carried in the ship under cold air refrigeration, will be landed in the markets of Philadelphia, New York and Boston in better condition than the average of our rail shipments.

Our government, our merchants and manufacturers are desirous of building up a great merchant marine for this country. Our government has the ships and our people furnished the money for building these ships;

therefore, the people own the ships, and if we ever have a merchant marine built up on a sound basis, large groups of people among the producers of the United States must take these ships and operate them primarily in their own service. Through the co-operative organizations of producers this can be done. Here in California we have the organizations, we have the production in large volume, through the government we have the ships, and we have the money with which to operate these ships, and transport that portion of our products that is consumed on, and adjacent to, the waterways of the nation, at very low cost, thereby giving us some voice in the fixing of the transportation charges that our present vast and increasing tonnage is forced to pay, and at the same time building up our merchant marine, and eventually stabilizing and expanding our entire transportation system to meet the growing needs of the nation.

PERMANENT ROADS IN ARIZONA

By M. E. Bemis

Maricopa County, Arizona, has completed about one-third of her eight and a half million dollar road building campaign. The farmers are already beginning to reap the benefits in decreased cost of marketing products. The saving to the farmers and others using automobiles or trucks will be no inconsiderable sum when the entire system is completed.

The road so far constructed and the contracts which have been let are for a concrete road of varying widths and thicknesses according to the amount of traffic. In laying out this road system it was planned to make every farm an outlet to the nearest town, and to that end the design of the road system was to build a permanent road within not more than a mile of every farm. This was accomplished with the exception of a few of the districts farthest out. Another factor that was kept in mind was to tie in with state and national highway systems. Nearly 100 of the 300 miles of road will be a part of the state highway system, and more than 60 miles will be on the Bankhead National Highway, connecting with California through Yuma.

TOLLING COTTON

Many of us who are old enough to recall pioneering days may remember the old time grist mill where payment for the making of flour and meal was taken in toll from the grist. Now comes a plan to toll cotton. A dispatch in the daily press says:

"One hundred and fifty bales of Egyptian long staple cotton, the product of Arvin farmers, has begun the first leg of a journey that will carry it to Prague, Czecho-Slovakia.

"The cotton will be fabricated in that industrial center and is later to be marketed through the great English markets at Liverpool and Manchester. The selling arrangement, worked out with the aid of the United States department of commerce, is known as the toll plan. By this method cotton of the highest quality grown in the United States is sent into central European countries, impoverished by war, where it is made into expensive cloth and laces, finally being distributed from world market centers.

"Until the raw material has been transformed into cloth and final sale made to retailers throughout the world growers do not receive compensation direct from the transaction. They are, however, extended loans from the war finance board of 14 cents a pound, running for a period of six months with renewal at the end of that period if final returns from the cotton have not been made.

Kern County's shipment, the first to be made from California, was loaded on motor trucks at the Arvin gin and transported to San Pedro to be shipped to Hamburg.

Kern County cotton planters who have placed cotton in the consignment are L. B. Nourse, H. G. Clardy, C. B. Landers, R. S. Routzong, G. G. Ives and A. T. Nelson, all of the Arvin district.

PROTECTING ORCHARDS FROM WIND

(Continued from Page 623.)

more troublous and winter bareness of foliage welcome to allow sunshine to enter and dry up muddy roads, etc. But in parts where large growing species of cottonwoods, etc., have been planted they are denounced as soil robbers and producers of too much cumbersome litter. In the desert valleys they are being cut out, root and branch. Deciduous species of tamarix and eleagnus have been planted and make good but not lofty windbreaks. Of late years the evergreen Tamarix articulata has superseded in popularity all earlier plantings in hot dry sections where winters are also generally quite frosty. This tree, though somewhat low of stature, grows quickly and thickly, is very hardy, needs little care or attention of any kind. In the Antelope Valley, where protection from wind is desired during blossoming and fruiting seasons only, deciduous fruit trees that leaf out early are planted along roadsides or on property lines. This is a plan quite popular with the pear growers of Antelope Valley. Early apricots, peaches and crab apples protect up to pear harvest. Some set double rows of pears every sixth row in the orchard, across path of prevailing winds, the trees alternating so that a check of surface winds is effected, no space lost or total crop returns reduced below the neighborhood standard or record. In citrus growing districts the use of seedling avocados has been recommended. They are rapid growing, comparatively hardy, thick and heavy of foliage, and therefore effective deterrents to velocity of surface winds. They are ornamental, produce fruit and, possibly, one might so discover or have and thrust upon him a variety that would prove a bonanza.

HONOR TO MRS. TIBBETS

When President Theodore Roosevelt replanted, in 1903, one of the two Washington Navel orange trees which had been brought to California by Mrs. Eliza Tibbets from Washington in 1873, he remarked as he recalled the thousands of acres of Navel trees, every one of which were from the two original trees: "I am glad to see that this tree shows no signs of race suicide."

Although that tree, now over a half century old, is not showing great vigor, it remains the progenitor of many thousands of trees and of a great industry.

But few productive industries can show such increase from such small beginnings.

The one responsible for the planting of those two little trees and watering and tilling until their worth was proven, was honored by the citizens of Riverside last Saturday by the erection of a memorial with bronze tablet.

The inscription on the tablet is:

"To honor Mrs. Eliza Tibbets and to commend her good work in planting at Riverside, in 1873, the first Washington Navel orange trees in California, native of Bahia, Brazil, proved the most valuable fruit introduction yet made by the United States Department of Agriculture, 1920."

Leavening Strength Tells the Story
The price you pay for baking powder doesn't determine the results you will have on bake day — it's the leavening strength that counts.
You may buy a baking powder for less than Calumet and think you are practicing economy. Don't be misled — the bakings you spoil will make those that are successful exorbitant in cost.
CALUMET
BAKING POWDER
has successfully proven, during the past thirty years that it contains more than the ordinary leavening strength. That's why bakings where it is employed never fail to raise properly.
Calumet is used by more housewives, leading chefs, domestic scientists, restaurants, hotels and railroads than any other brand. Millions buy it — you should try it.
A pound can of Calumet contains full 16 oz. Some baking powders come in 12 oz. cans instead of 16 oz. cans. Be sure you get a pound when you want it.
NOT MADE BY A TRUST

CHRISTMAS GIFTS

She needed pots and a new floor broom
And window shades for the children's room;
Her sheets were down to a threadbare three,
And her tablecloths were a sight to see.
She wanted scarfs and a towel rack,
And a good, plain, useful dressing sacque,
Some kitchen spoons and a box for bread,
A pair of scissors and sewing thread.
She hoped some practical friend would stop
And figure out that she'd like a mop,
Or a bathroom rug or a lacquered tray,
Or a few plain plates for every day.
She hoped and hoped and wished a lot,
But these, of course, were the things she got:
A cut glass vase and a bonbonniere,
A china thing for receiving hair,
Some oyster forks and a manicure set,
A chafing dish and a cellaret;
A boudoir cap and a drawnwork mat,
A sterling this and a sterling that;
A gilt edge book of a lotty theme,
And fancy bags till she longed to scream;
Some curling tongs and a powder puff,
And a bunch of other useless stuff;
Though she inwardly raged, she wrote
To all of her friends the selfsame note,
And said to each of the friendly host—
"Just how did you guess what I needed most?"—Ella Bently Arthur, in Life.

FATHER 'N' MOTHERTOWN

By Annie Hamilton Donnell in The Farmer's Wife

SARAH POTTER was having her short season of actual beauty now when stars shone in her gray and faded eyes. She was getting ready for Aurora! Her soft lean cheeks grew a little pinker every waiting day. She stood and walked straighter; she smiled oftener, as though practicing for Aurora. Now and then the most unexpected thing of all happened—Sarah Potter sang!

When her old husband, Asher Potter, heard those high, thin clarion notes, he sang too, but inwardly in a little music room of his soul that no one, not even Sarah, knew. Asher was a dumb man, the neighbors said, and even Sarah acknowledged it to herself. Only the Architect who designed that secret little room, and Asher who sang in it at rare, glad moments, knew of its existence. Asher was very happy, too, just now. In his way he was getting ready for Aurora.

"I'll make Aurory's bed tomorrow," sang Sarah as she worked—actually sang it in words. Most any words will "go" with the tune of joy. "Today I'll make a batch of cookies for her to take back to school to treat with. She always said, 'Mother, your cookies are the best!' The best, the best, the best!" sang Sarah.

Aurora was all they had, very nearly literally all. Since Asher's stiff old joints had ended his carpenter work, and Sarah's eyes interfered with the delicate old-fashioned embroidery that had earned many difficult but thankful dollars, they had been really poor though they never confessed it even to each other.

If it had not been for Aunt Roxanna, Aurora would not be at a fashionable school this minute packing up to come home for Christmas. Roxanna Potter had married wealth and she had been the only Potter to marry or achieve it.

"Cookies—cookies—cookies! 'Your cookies are the best!'" sang Sarah over the kneading board. What if she made a cooky man! She always had made one, long ago.

"Asher," she called, "you there?" Where else would he be but "there," easing his aching old joints on the sitting room lounge? "Asher, what if I make a cooky man for Aurory? Would you say I'm a crazy old loon?"

"Sally," called back Asher from There, "you go ahead and be a crazy loon! Make two so's if one scorches."

Sarah made three so's if two scorched.

Christmas was eight days off. Aurora was seven off. She would come early on Christmas eve but in plenty of time to hang up her stocking.

"I hope she'll have one mended," smiled Sarah's thoughts. Aurory was so likely not to come home mended. That was really a delight to Sarah; it meant long happy sittings at the mending basket. From conscientious scruples she would scold the child, of course. Scold Aurory!

Another day—two, three more went joyously by.

"The living room worries me, Asher," she sighed, taking a little vacation from joy.

"Living room? What's the matter with the living room?" Asher was not worried. His gaze wandered affectionately from shabby friend to shabby friend.

"Look under your feet. Under my feet—it's worse this side of the room. It couldn't be a thinner rug without it—without it died!"

The emaciation of the faded old carpet was extreme. How would it look to their girl, fresh from beautiful rich rugs? No amount of rearrangement of furniture, of covering up, of hiding could save it. The whole large room was shabby with it. Like the one horse shay it had apparently gone all to pieces since Aurora's last homing.

To Aurora at the fashionable school the days crawled rather than leaped toward her holiday week. A shamed Aurora confessed to herself that she was not thrilled about going home. Of course she ought to be but she was not. Father and Mother and the shabby, deadly dull little old home could wait until June.

"It's so far to go for such a little while——" She broke off the thought midway, to cry scornfully to Aurora Potter, "Shame — for mercy's sake blush, can't you?"

Aurora was 17. Aurora was daintily pretty, petted, spoiled. A number of circumstances excused, a very little, this unnatural frame of mind. Her teachers and friends had done their best to widen the distance between this luxurious life and home.

Home was unluxurious! The memory of it in its humble details was growing more and more appalling to this spoiled young creature. Lest the real Aurora hear, she whispered to herself that she ought to have been born differently, with luxurious surroundings and rich parents. Fate had been unkind.

"I feel luxurious and rich in my bones," she whispered. The real Aurora heard and lashed her with a scathing tongue. The two Auroras often quarreled.

Three days before Christmas two notable things happened in the little Potter home. Sarah Potter went abroad on mysterious errands and a letter came. The letter came last.

"Asher, I'm going out a spell. I've put your liniment and the Weekly Events on the table beside the lounge. You've no need to stir till I get back." She bustled nervously about the room, then suddenly stopping beside the aching old figure, leaned down and kissed Asher. Kisses were not unknown between them but they husbanded them. Sarah husbanded this one now.

"On your bald place to make the hair grow," she laughed softly. "Asher, I wish you didn't ache! I could be so much happier if you didn't ache!"

"You're happy enough now," he laughed up at her. "If Aurory don't come soon you'll burst!"

"Well, I guess I'm not the only—I guess somebody else in this room's happy, too!"

"I wouldn't contradict you," he beamed.

Sarah's first call was at a well to do looking little cottage where she was not known. She was not ashamed but she preferred it to be a strange house. This was purely business on which she had come. The housewife herself came to the door, opening it rather warily.

"I'm not an agent for a living thing," smiled the pink cheeked, star eyed Sarah. Even this "business" she had come on, distasteful as it was could not dim her joyousness. Her shabby old suit could not make her homely and commonplace today.

"I've come to see if I could rent your front room rug," she said hurriedly, to get the worst over. "For ten days, beginning day after tomorrow. I'll pay the rent in advance. Perhaps you don't break weeks. I mean perhaps you'll want two weeks' rent. I'd be willing. I thought—I thought I'd offer three dollars if that was enough."

For very breath the eager voice stopped. Only the fortunate possession by the astonished housewife of a sense of humor saved the situation. She found herself smiling instead of shutting the door. Eagerly Sarah began again.

"My little girl's coming home for a week and the rug on the living room floor won't do—won't do. I can't stand Aurory's seeing the new holes in it! I asked at the corner store and they said you hadn't got any children to be coming home——"

"No," the other woman said quickly. "No, not—now." She was remembering how proud she had been of new things with which to welcome a little girl home, once on a beautiful time. She was not smiling now.

"Then if I could—if you'd be willing——"

"Come inside," the woman said. She led the way to her front room. On the threshold Sarah cried out in dazed admiration.

"Oh, it's a beautiful one! I'd pay for every spot but we wouldn't get any on! There's nothing but Asher's liniment and he'd rub it on in the kitchen."

"Sit down," the woman said. She could not speak more just yet; she must have time. The thought of that little girl who was coming home hurt. Her little girl would never come home.

After a moment she regained her composure.

"I don't think I just caught her name——" she began.

"No, you likely wouldn't. It's a hard name to catch. Aurora—that's it. It means light. Her middle name is B."

"Bee?"

"Just B, letter B. I never told Aurora what it stood for. Her father always told her it was Beautiful. She don't use it now so it don't matter. Somebody else named her—I felt obliged to keep the B of it anyway; it didn't seem fair not to. But I wasn't going to have people laugh."

Half an hour later Sarah Potter issued forth from the well to do little house and hurried away on her second errand. This was to a drug store but not for drugs.

"You keep singing machines, don't you? There's some now, there in the back. How much could I rent one a week for? Beginning day after tomorrow afternoon—and some records. Isn't that what they're called? Two dollars' worth of records and rent. I couldn't go higher than that. Have you got any that play something welcome homey?" She smiled up from her lesser stature to the man's big height. Again Sarah was fortunate. This man could smile instead of scorn. The arrangement was made to their satisfaction and Sarah went joyously home. He said that the rent would be only a dollar and a half altogether. And only one for the rug!

"Bargains!" sang Sarah under her breath. "Bargains, bargains, bargains!"

"Sally, that you?" Asher called as she opened the outer door. "There's a letter from Aurory! No, I haven't opened it but you got to quick! Don't stop to take anything off."

As if she would! She ran in to Asher like a girl, holding out her hand for the letter. With eager fingers she tore it open.

"To say when she's coming. As though we didn't know! Maybe, though, she's changed her train?"

Sarah folded the letter. "Yes," she said slowly. "She's c h a n g e d it, Asher. She's going to take the one to New York."

"Going to—what?"

"She isn't coming, Asher. That's all. Aunt Roxanna's invited her to a hotel in New York for Christmas week to show her the sights. Aurory says——"

"Well? What's Aurory say?" The old voice was sharp with pain.

Sarah slipped out of even Asher's sight. She was not going to tell him that Aurory said it was going to be great, with a line under the great.

Alone Sarah fought with her own pain; then went back to comfort Asher's. Here was occasion to husband another kiss.

"To make your hair grow," sobbed Sarah.

(Continued next week.)

HINTS FROM HOUSEKEEPERS

Cockroach Poison

Some time ago I saw a request in the Cultivator for method of ridding the place of cockroaches. I have found the following a sure thing:

Take equal parts of 20 Mule borax and bar sugar. Mix and spread where there is any sign of them. As it is not poisonous, it is safe to put anywhere. —F. Dean.

SIMPLY MADE CHRISTMAS GIFTS

Sealing Wax Beads

These are easily made and are attracting much attention as popular holiday gifts. The wax may be purchased from some gift shops, department stores or novelty stationers. An ordinary knitting needle—a steel one used for knitting socks is preferable—is the foundation. Around this wrap a piece of paper corresponding in size to the desired size of the bead. Paste the paper on so that it will be firm and yet can be slipped from the needle after the bead is molded. Take a stick of wax, select your foundation color for this, heat over a flame and work the wax off onto the paper by "touching" it on. If you wish a smooth bead take wax of other colors and work it on the foundation while the latter is still soft. Now mold the bead with your fingers (the heat of your hand will keep the wax soft) into the shape desired, then slide the bead off the needle. If you wish the bead to have raised surfaces, apply the colored wax when the foundation is hard. The beads are strung on colored silk cord and are held in place by knotting the cord. Any number of designs may be worked into these beads. It is not necessary to plan special designs, as the colored wax roughly applied will produce very striking designs. The beads may be any shape and size. Most strings have a large ornament, made in the same way, at the bottom of the cord. Black or henna colored wax make very good foundations.

Pongee Handkerchiefs

Much favored for gifts for men this Christmas are pongee handkerchiefs with borders of colored threads drawn through. A monogram in the corner may be embroidered in the same color as the drawn threads. To make borders, choose silk or mercerized cotton thread of one or more harmonizing colors, yellow and lavender, blue and green, etc. Cut pongee in square, allowing plenty for one-half inch hem, or less as preferred. Inside the hem lay your thread on the handkerchief in combination to plan a pleasing design. Then when you have decided where the colored threads are to go draw two threads of pongee smoothly, then start the third from both ends—to make sure it will slip out easily. To one end tie loop of doubled thread of sewing silk of any color. Pull this through. Then through doubled end of this sewing silk slip double strand of colored silk or cotton which will make your permanent color line. Draw sewing silk back through handkerchief. It will pull after it the two double strands of colored thread, leaving in place of the three drawn pongee threads four threads of the heavier colored thread which stand in a beautiful even cord. A few moments trial will show how very easy and simple this work is. A little practice will show very effective spacing and placing of these decorative threads. As a general caution, don't carry the design into the center of the handkerchief—keep it well toward the hem in distinct border, with colored threads not too far apart. Also it is more pleasing to have the heavier color—the larger number of threads—near the hem. A suggestion for making a neat hem is to draw in one of the colored threads on line where hem will be, then when hem is turned for sewing the small stitches can be taken through the colored thread and do not show on right side. This also makes most attractive finish.

FOR THE TREE

Tiny gingerbread men are always attractive on the tree. Everybody, grownups and all, likes them. It is a good plan to have one for every contemplated guest and then at least twice as many for the friends and neighbors who drop in through Christmas week—we are firm believers in the Southern custom of calling the whole week Christmas, up to and including New Year's. The brown, spicy, absurd little gingerbread men can carry much happiness from your tree into other homes. Don't forget that Christmas is the children's day, but don't for a single little instant forget that the whole meaning of Christmas is lost if we do not see the child's heart in every single human on that day of days when all are children together.

JOHNSTON TURBINE CENTRIFUGAL PUMPS

Installations can be made in wells 8 inch or larger. Produce 100 to 4,000 gallons per minute. Ask for Folder No. 4. Johnston Pump Company, 407 E. 3rd St., Los Angeles.

GOOD THINGS FOR THE HOLIDAYS

Steamed Pudding With Carrots

1 cup carrots, 1 cup potatoes, ½ cup melted butter or shortening, ¾ cup brown sugar, 1 cup flour, 1 teaspoon nutmeg, 1 teaspoon cinnamon, 1 teaspoon salt, 1 teaspoon soda and 2 cups raisins. Put the potatoes and carrots through a fine grinder twice. Put the mixture together, pour into a buttered mold and steam for 2½ hours.

Hard Sauce

Delicious to serve with this pudding is hard sauce made by creaming 1-3 cup butter, adding 1 cup powdered sugar, 1-3 teaspoon lemon extract and 2-3 teaspoon vanilla. The sauce may be attractively served by placing it in little mounds around the pudding on a platter. Chopped nut meats or cherries may be dropped on top of the mounds of sauce.

Turkey Dressing (Swedish Style)

Try this dressing for the turkey: 2 cups stale bread crumbs, 2-3 cup melted butter, ½ cup raisins, seeded and cut in pieces, ½ cup English walnut meats broken in pieces, salt and pepper and sage to taste. Mix ingredients in the order given.

Pear Salad

A toothsome salad may be prepared by laying canned pears (cut into halves lengthwise) on head lettuce leaves, filling the pears with blanched almonds sliced thinly the long way, and covering with a spoonful of boiled dressing.

Parker House Rolls

Nothing can make a meal more festive than the hot rolls made after this recipe: 2 cups scalding milk, 3 tablespoons butter, little salt, 1 yeast cake dissolved in ¼ cup lukewarm water, flour. Add butter, sugar and salt to milk; when lukewarm add dissolved yeast cake and about 3 cups flour. Beat mixture until light, cover, and let rise until light. Cut down and add enough flour (about 2½ cups) to knead. Let rise again, toss on floured board; knead, pat, and roll out to one-third inch thickness. Shape with biscuit cutter, first dipped in flour. Dip handle of case knife in flour and with it make crease through middle of each piece; brush over one-half of each piece with melted butter, fold and press edges together. Place in greased pans, one inch apart, cover, and let rise, then bake in hot oven for 12 to 15 minutes. As rolls rise they will part slightly, and if hastened in rising are apt to lose their shape.

To Blanch Almonds

Cover almonds with boiling water and let stand several minutes. The skins will then slip off easily between the fingers. Dry almonds between towels.

CRANBERRY FROLIC FOR CHRISTMAS

In decorating the room where the frolic is to be held, string berries on heavy cotton thread and make green paper chains.

In the "necklace" game partners are necessary. To each couple is given a long, strong cotton thread, with a needle at each end. When the signal is given the pair commence stringing berries from both ends of the cotton. The winners are the ones who have the most berries on their string when the signal is given to stop.

Cranberry "toss" is a popular game. A deep pan or basket is placed on the table. The players stand in a line, an equal distance from the basket, are each given a certain number of berries, and try, in turn, to toss them into the basket. The winners are the fortunate ones who get the most in.

The younger folk will delight in the following: Have two players in the game at a time. They are given an equal number of berries, told to kneel on the floor and to make a circle of the fruit around them, placing each berry an inch from each other. The one who finishes first is the winner.

Filling a tub with water, allowing the guests to stab at cranberries floating on its surface, using hatpins as weapons, is also great fun. The person securing the most berries naturally wins.

A grand prize of a mammoth cranberry pie to the couple winning the most games is a pleasant surprise at the close of the evening.

New Lamp Burns 94% Air

Beats Electric or Gas

A new oil lamp that gives an amazingly brilliant, soft, white light, even better than gas or electricity, has been tested by the U. S. Government and 35 leading universities and found to be superior to 10 ordinary oil lamps. It burns without odor, smoke or noise—no pumping up, is simple, clean, safe. Burns 94% air and 6% common kerosene (coal-oil).

The inventor, W. V. Johnson, 31 N. Fifth St., Portland, Ore., is offering to send a lamp on 10 days' FREE trial, or even to give one FREE to the first user in each locality who will help him introduce it. Write him today for full particulars. Also ask him to explain how you can get the agency, and without experience or money make $250 to $500 per month.

IT AIDS GROWTH!

Cod-liver oil contains elements that science considers needful in promoting growth and sustaining strength.

Scott's Emulsion

of rarest medicinal cod-liver oil, should be given liberally to the boy or girl who may be a source of worry.

The California Plan of Livestock Auctions

By R. P. Royce

IN former articles it has been pointed out that the more general abuses of the public sale method of selling livestock are:

1. Wash sales, i. e., selling animals at fictitious prices, by-bidding, etc.
2. Extensive use of personal notes in settlement for purchases.
3. Domination of breeders by a certain class of auctioneers, fieldmen and publishers of farm and livestock journals.
4. The lack of a uniform plan of selling.
5. The lack of satisfactory machinery for the adjustment of disputes, especially for safeguarding the beginner.
6. Difficulty in securing transfer and registration papers promptly.

World's Record Maker

Miss Aaggie Ormsby Segis and Manager Earl Sturgis. This cow is owned by Fred Hartsook, Lankershim, and is world's record two year old Holstein for 305 day test. In 284 days she produced 20,075.1 pounds milk, making 720 pounds butter. She still has 21 days to go and is milking around 65 pounds daily.

Last week it was explained that just at the time the first public sales were being projected in this state, a group of representative breeders set about to develop a plan that would tend to eliminate or minimize the more flagrant abuses, with the result that the California Breeders' Sales and Pedigree Company was organized. A copy of the sale contract was reproduced.

Let us now see just how far such a contract goes toward solving the various problems of the public sale.

Inasmuch as there are two principals concerned in a public sale transaction, the seller and the buyer, it is natural that a satisfactory contract must be so executed that the rights of each party are safeguarded. In considering the California plan, the buyer will be given first consideration. A buyer at a public auction wants to know first of all that the offering will be as represented; that cattle advertised will be sold on their merits; that a reliable guarantee will be given and that he will not be forced to meet competition from by-bidders or wash sales; that he will receive the proper registration papers and transfers promptly and finally that he will be provided with satisfactory machinery for the adjustment of any claims after the sale is over. Clause 14 of the sale contract says:

"The consignor positively agrees that after having consigned stock to the sale mentioned on the reverse side of this sheet, he will not dispose of it by private sale, either prior to or during the progress of the sale, and he hereby contracts to pay a penalty of 25 per cent of the actual selling price as an agreed forfeit for a violation of this condition."

Clause 13 provides:

"All defects or blemishes or unsoundness of any nature known to the seller must be stated at time of entry and upon the entry."

So far as the breeding guarantee is concerned, the matter is taken care of under clause five as follows:

"The consignor guarantees every animal sold to be a breeder. If a female sold as bred proves not to be with calf, or an open female fails to conceive at first service, the buyer must report the fact within ten days after the female comes in heat, to both the seller and the president of the California Breeders' Sales and Pedigree Company, in writing. If the buyer elects to breed to his own bull he will be given four months to try the cow. If she fails to conceive within that time she must be shipped back to the seller's ranch, and notice in writing given the seller at least four days in advance of shipment. If the cow fails to conceive within four months in the hands of the seller, he must refund immediately the full purchase price to the buyer. Expense of shipping back to seller's ranch, and expense of shipping back to buyer in case cow is returned safe in calf, is to be shared equally by seller and buyer."

Furthermore, "that all defects and unsoundness of any nature known to the consignor will be stated; that no animal suffering from contagious disease, or that is vicious, will be sent by him to the sale; and that he will not consign a cow that has been bred without giving name and number of bull and date of service; that no animal that has aborted with or since last calf will be consigned unless so stated."

The buyer is protected from buying tubercular cattle under the following provision:

"Tuberculin test certificates, signed by a veterinarian approved by the California Breeders' Sales and Pedigree Company, must accompany the entry of all cattle over six months of age, and tests must have been made not more than sixty (60) days nor less than forty (40) days before date of sale.

"The consignor agrees to permit the buyer to tuberculin test all animals sold, the test to be made by a graduate licensed veterinarian, such test to be made before cattle leave the sales grounds and in the presence of the seller or his representative if the seller so desires, and the consignor agrees to receive back at the purchase price any animals that react to this test. The seller to have no responsibility for any subsequent reactions."

The abuse of wash sales and the practice of by-bidding has been headed off by the following provision of the sale contract:

"All entries must be for absolute sale. There shall be no by-bidding directly or indirectly, nor any reserve. The consignor agrees to pay to California Breeders' Sales and Pedigree Company twenty-five (25) per cent of the price at which an animal is struck off if it is proven that the bid was a direct or indirect by-bid."

It is true, perhaps, that the above clause cannot entirely eliminate the practices mentioned, but it goes about as far as is humanly or legally possible to do. A seller seeking to connive with another in negotiating a wash

(Continued on Page 639.)

DISPERSAL SALE

65 Registered Holsteins

T. B. MINGS HERD

EL MONTE, CALIF.

Thursday, January 5, 1922

An offering of young, well bred Holsteins, in excellent physical condition, and including members of some of the breed's greatest producing families, among them

FOUR DAUGHTERS OF KING KORNDYKE PONTIAC 20TH, the $12,000.00 son of Miss Valley Mead De Kol Walker.

FOUR GRANDDAUGHTERS OF KING SEGIS ALCARTRA PRILLY, the four times Grand Champion Bridgford bull.

A GRANDDAUGHTER OF ADIRONDAC WIETSKE DAIRY MAID, the highest record cow on the Pacific Coast. (This heifer is sired by her $5,000.00 son, King Abbekerk Johanna Segis.)

FIVE GRANDDAUGHTERS OF MAID TUBBIE SEGIS, the great cow that made 1140 lbs. butter from 28,388 lbs. butter in one year.

SEVERAL DAUGHTERS OF KING SEGIS PONTIAC JANNEK, Grand Champion at the Southern California shows this year.

TWENTY A. R. O. cows and heifers with records up to over 30 lbs. butter in 7 days.

A BEAUTIFUL 30 POUND DAUGHTER OF MUTUAL FOBES LONGFIELD DE KOL, backed by four generations of high record dams, and selling heavy with calf to a richly bred son of Sir Pietertje Ormsby Mercedes.

GUARANTEED BREEDERS, TUBERCULIN TESTED AND SOLD SUBJECT TO RETEST

TERMS OF SALE: Responsible parties make arrangements before sale for terms of one-third cash, balance in three, six and nine months with sale managers.

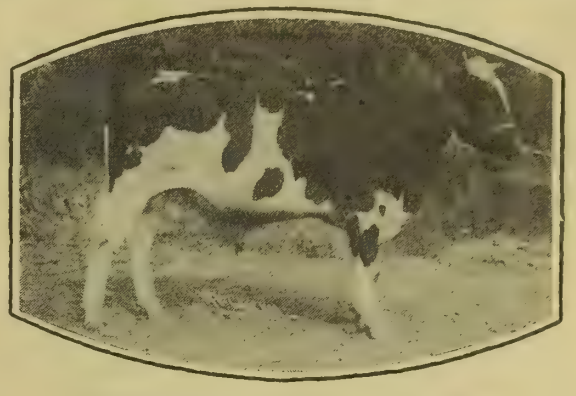
Management
California Breeders Sales and Pedigree Co.
C. L. Hughes, Sales Manager, Sacramento, Cal.

Auctioneers:
Rhoades & Rhoades, Los Angeles

Sale will be held under cover at T. B. Mings' farm, 2 miles south of El Monte, rain or shine.

Sir Prince Aaggie Mead



CONSIDER THE TREMENDOUS PRODUCTION AND DEMONSTRATED ABILITY TO TRANSMIT PRODUCTION ON BOTH SIDES OF HIS PEDIGREE.

His sire, King Aaggie Mead, is a son of the 1,000 lb. foundation cow Aaggie Acme of Riverside, who produced the 1,331 lb. world's strictly official record cow, Aaggie Acme of Riverside, who in turn produced California's only 1,000 lb. junior 2 year old, Miss Aaggie Acme Burke.

His dam, Miss Valley Mead De Kol Walker, with two records above 1,000 lbs. butter in one year, and now making a yearly record that promises to exceed her previous best record of 1,113 lbs., is a daughter of the 1,011 lb. 4 year old De Kol of Valley Mead 2d, who in turn is out of the foundation cow, De Kol of Valley Mead.

HE IS BEING GIVEN HEAVY SERVICE IN BOTH OUR HERDS. KEEP ONE OF HIS SONS IN MIND FOR YOUR HERD SIRE.

OWNED JOINTLY BY
Fred Hartsook LANKERSHIM, CALIF. and A.W. Morris & Sons Corporation WOODLAND, CALIF.

Tosantos Walker Mead

Born December 9, 1919
Exceptional Yearly Record Backing

His five nearest dams average over 1,000 lbs. butter in a year. He is out of a wonderful daughter of Prince Geische Walker and Sir Aaggie Mead De Kol. He is a show bull and is priced for immediate sale.

E. D. BARRY, JR. Workman and Azusa Ave., Covina, Cal.

HOLSTEIN Fred Hartsook RANCH CATTLE

We have assembled an excellent foundation herd of females and will be glad to have breeders call. Fred Hartsook, Lankershim, California.

Cattle Situation

By A. L. SPELLMEYER

CATTLE are chaotic, the situation in one place is different from that in the other place. Men who have money are buying and men who must have money are selling. Things are in a jumble, but everywhere an advance in beef price is expected in the next 30 to 60 days.

The north has had rain and it extended down to the mountains east of Bakersfield. Porterville prospects are good. In the west side between the coast and Bakersfield they are bad. The desert country out from Banning and toward Death Valley is good. Los Angeles County is yet without feed. Arizona is good. Northern districts of Colorado, Idaho and Montana have felt the cold snap and storms, and that supply is about done. Over three quarters of the beef used by Los Angeles has been coming from this north district. The cattle and feed in Southern California today about equals two weeks' slaughter supply.

Prices are anything. Rumor states the entire lot of Northern Arizona beef sold to Los Angeles packers on a $6.50 per hundredweight delivery price for grass fats, shipped two days. California fed cattle in instances don't even draw a six cent beef price as they are close to home and killers figure them theirs at their own price, command and desire. The finest fed four cars I have seen for finish and smoothness near Los Angeles, and I mean as beef steers, not as to breeding, lay unsold at 7 cents, and these steers should dress out close to 60 per cent. The premium has switched from light to heavy cattle, and large 1,200 pound to 1,300 pound steers are bringing two cents better in carcass beef price than light fat steers.

There is a considerable demand for feeders at low prices, equivalent for a three year old steer to about $5 per head less than a good yearling cost two years ago.

The association names prices in some instances higher than those given. I know of some lots of best top cows being held for six cents.

As far as the cattlemen are concerned conditions are paralyzing, as the industry remains on a half cost to third cost basis of production. Only a few can meet prices on their range expense. Every pound of beef being finished in feed yards costs at least ten cents per pound today, with a price of anywhere from $6.25 to $6.75 for it on an average.

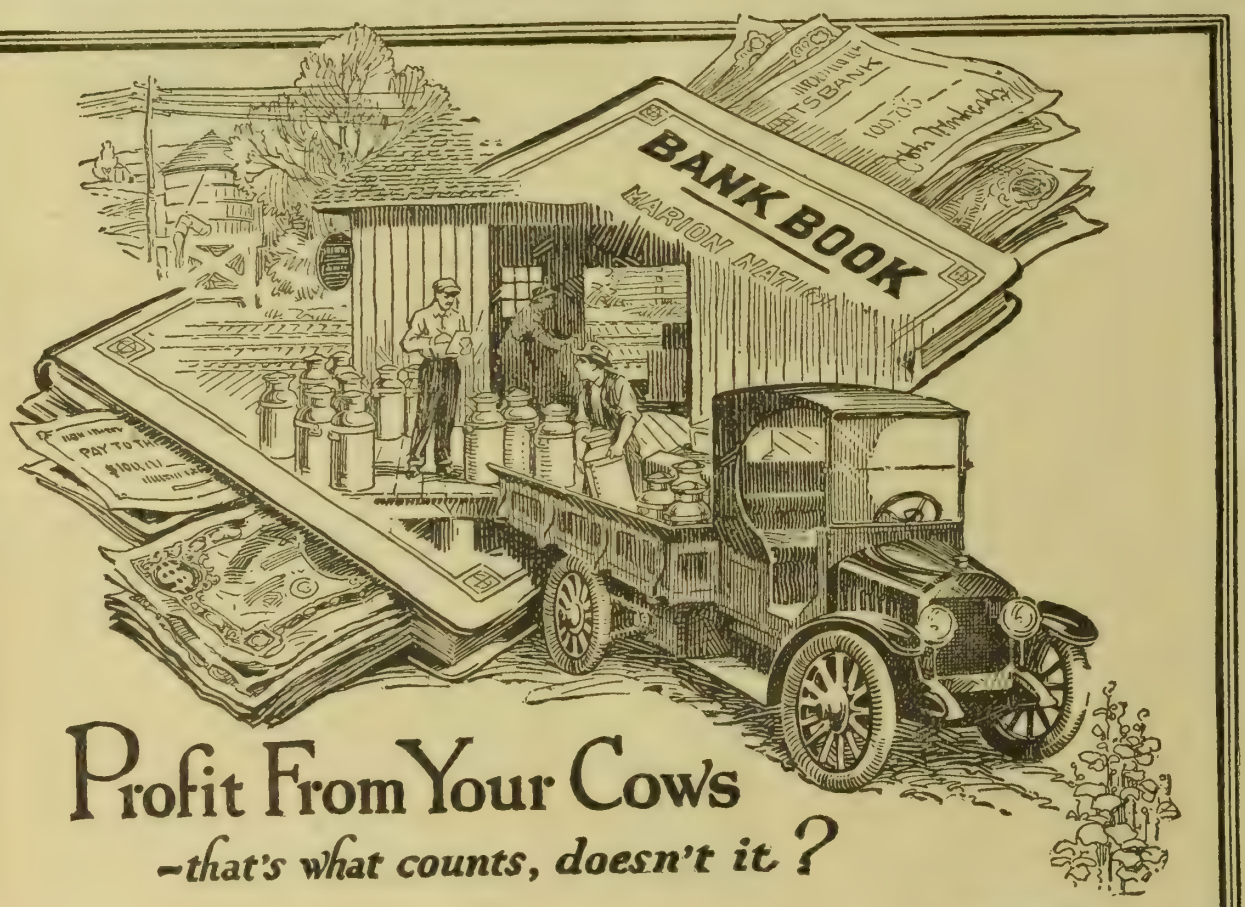
Notwithstanding Mr. Meyers' visit here and many promises, war finance has been a promise more than a fact. A few hundred thousand are reaching California cattlemen, but it's not even a fog for a parched field. Most of the money has come to some banks and loan companies, and money for cattle is harder now to get than six months ago. Another thing is that with present low prices loaning values are shattered until they are far less than normal and a brave loan today on these values would be 25 per cent or less on actual cost of production and duplication of these animals on our range if we grew them now on present expense. The war finance talk seems to have been more of a bundle of hay in front of a mule than a good feed for the starving animal, but it may possibly be that it needs a little more time to have it work.

The wide variation in beef prices permits the settling of ancient scores as the killer may desire, and today the killer is king. The cowmen who ran up against the bunch in this producer fight are in a hard way, and the plums are handed to those who sat on the fence or played pro during the past few years.

A northern buyer and speculator today told me from a week's visit and looking into things here, he thought the Los Angeles bunch needed a lesson, as they had things too much their own way on beef in these parts, and he hoped Portland would revive soon so as to give it to them. It seems Portland came clear to San Joaquin for stuff lately. Reprisal methods are bad at any time, but they are surely in full practice in our fair district of Los Angeles. One man, a prominent individual who is luckily wealthy otherwise and who has been fighting the cattlemen's fight, is according to rumor unable to get even a bid on fat steers here, fine ones, when these northern Arizona grassers are bringing $6.50. This particular man has only one bad fault, and he is against Los Angeles stockyards, and possibly he will again, as he did last year, have to go to Portland, the nearest stockyards, to get the market and a price for his steers.

The Lewis plant is rebuilding and will be the most modern and complete plant in Los Angeles when finished. Rumor states Bliss is killing at Hauser's. Woodward and Bennett have gone into the quality cattle trade strong and are handling some of the good trade. The Globe yards are full up and "Blacky Moss" is tearing his hair to find a way to accommodate people, as room there is at a premium. Blacky is some diplomat to keep them all satisfied. Geo. Woodward is running a dandy little plant called the L. A. and is adding to it, as he is doing a fine business. Several little killers are increasing facilities. The plant out Pomona way is said to have closed a December-January contract for $7 to $7.50 steers.

The producers' day is as sure to come when he will have the edge, as it's killer-retailer's day now, and no time has been riper for packer-producer cooperation.



Profit From Your Cows

—that's what counts, doesn't it?

YOU keep cows for one reason only—for profit. But not all cows are profitable; some constitute an actual deficit at the end of the year. Many a cow that has every reason to produce profitably joins the ranks of the "poor milkers" just because her milk-making organs are below par.

Make no mistake about this—there are scarcely any so-called "poor milkers" that cannot be made to yield normally and profitably by the medicinal aid furnished by Kow-Kare, the great cow medicine. Every dollar spent for Kow-Kare will put itself, and something besides, back in the milk pail.

Kow-Kare is a cow medicine—not a stock food. It has positive medicinal qualities that act vigorously on the genital and digestive organs and make them function naturally. For a quarter century this famous medicine has been widely used as a preventive and unfailing treatment in such cow diseases as Barrenness, Abortion, Retained Afterbirth, Scouring, Bunches, Milk Fever, Loss of Appetite, etc.

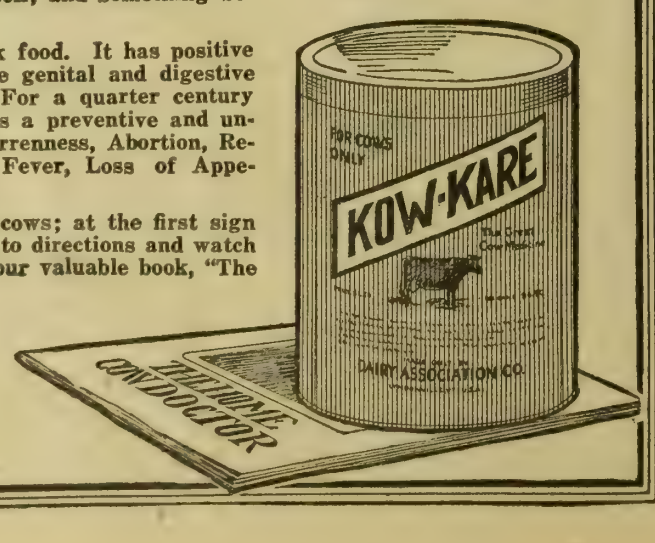
Keep close watch on every one of your cows; at the first sign of failing milk-yield, use Kow-Kare according to directions and watch the result. Write us today for free copy of our valuable book, "The Home Cow Doctor."

Kow-Kare is sold by general stores, feed dealers, and druggists at the new reduced prices- 70c and $1.40

DAIRY ASSOCIATION CO., INC.
Lyndonville, Vt.

"Penny-a-Day Prevention."

Thousands of successful dairymen use Kow-Kare regularly a part of every week during the winter to keep the assimilation and digestion in good order and throw off disease. Many of the most serious disorders that arise during the calving period can be prevented by using Kow-Kare for a couple of weeks before and after. Don't overlook this suggestion.



Livestock News Notes

Fred S. Stimson, a leading Holstein breeder of Washington, director of the Holstein-Friesian Association of America, president of the Pacific International Livestock Expositon, and well known to nearly all the Holstein breeders of this state, died at his home in Seattle, Thanksgiving morning. Mr. Stimson as owner of the Hollywood herd of Holsteins was one of the constructive breeders of the West and contributed much to the development of the dairy industry of the Pacific Coast. His death is a real loss to the livestock industry.

Lady Silken Golden Glow, a Jersey cow owned by Pickard Bros. of Oregon, has just completed a year's record of 1038.59 pounds fat from 14,939 pounds milk. This record is just 1.49 pounds of fat less than the present world's record held by Plain Mary.

The first public sale of Holsteins of the 1922 season is scheduled for January 5 when T. B. Mings of El Monte will disperse his head of 60 females. This is one of the well known herds of Southern California and breeders are looking forward to the event with interest.

The first prize aged Shorthorn bull at the Chicago show was Carpenter and Ross' Mazwalto Monarch. Princely Stamp, the Colorado bull that was champion at the 1918 Los Angeles show, was second. Rosenberger had the winning two year old in Cloverleaf Royal.

The grand champion wether of the Chicago show was a Shropshire. California had the reserve on a grade Southdown lamb.

The animal husbandry division of the university now has 68 two year old steers, 24 yearlings and a carload of calves in the experimental feeding lots at the university farm. All these cattle were raised on the university's range in El Dorado County. The older stuff was sired by grade or scrub bulls and the calves by pure bred Shorthorn bulls. College men state that the latter show marked improvement in quality, uniformity and weight. The cattle will be handled in various ways and the results made public when the experiment is closed.

A late report indicates the University of California won second with the cross bred senior steer calf, California Sultan, in a class of 22.

At the annual meeting of the National Swine Growers' Association, held at Chicago last week, the dues were reduced from $5 to $2. A resolution was adopted urging fair managers to require that sows two years

old or over must show satisfactory evidence of having suckled a litter.

Lula Mayflower, the California grand champion, sold at auction for $1.10 per pound. Lula weighed over 1,300 pounds at the time she started on her trip to fame.

James McGillivray, Sacramento, reports death of the Holstein bull, Colony Zarilda Newman. His dam is the wonderful producer, Zarilda Clothilde 3d's De Kol, world champion for yearly milk production under strictly official test, one of the few cows to have two yearly records over 1,000 pounds, and one of the two only cows to have two yearly milk records over 30,000 pounds.

Straloch Farm, Davis, has recently sold three of their young boars to breeders attracted by the records made at the state fair by the Straloch Poland Chinas. Geo. C. Need of Galt purchased the first of these. The other two are litter mates of "Westerner C," 1921 junior champion boar, one having been purchased by Jas. R. Day of MacArthur, and the other going to the California Polytechnic School at San Luis Obispo, where it will head the new herd established under the recent appropriation. The Polytechnic School also bought a Hampshire ram lamb, "Straloch 6," a first prize winner at the California National Livestock Show, and will use him to head their new flock. Beckman Brothers of Lodi have also secured one of the Straloch ram lambs, while three others went to Miller & Lux.

BUTTER PRICES

Time was when a little town in Illinois by the name of Elgin set the prices for the butter market of the United States. We believe it would be better for the dairymen of the country if she could still continue the price making. As it is today the greatest butter market in the world is New York, and its markets absolutely dominate the markets of the entire country, hence one reason for the great interest dairymen have taken in securing a protective tariff on butter. There are no great quantities of butter imported, but there is sufficient so that now and then a small amount dumped on the New York market when it is full of local productions will cause a break and a material lowering of prices. Even farthest western prices are affected, and one small importation has caused the loss of hundreds of thousands of dollars to the dairy industry in one day. The National Dairy Union is making an especially strong appeal for a "tariff particularly to protect New York dairy market from demoralization and fluctuation and to stabilize the dairy industry of the entire country."

PRICES OF LIVESTOCK

The agricultural statistician of the California cooperative crop reporting service gives the following information on the prices of livestock in comparison with a normal as of November 1, 1921:

"Prices are always of interest to the livestock producer so the crop reporting service included an inquiry concerning the price of cattle and sheep f. o. b. ranch in the schedule on condition of pasture. Returns were received from 150 correspondents on cattle and 70 on sheep. The results by districts are shown in the following table:

Price on Ranch Live Weight Per 100

	CATTLE			SHEEP		
Dist.	Steers.	Cows.	Calves.	Wethers.	Ewes.	Lambs.
1	$5.20	$4.15	$7.40	$4.00	$3.50	$5.50
2	5.60	4.30	7.40	4.00	3.25	6.00
3	5.70	4.60	8.20	4.75	3.75	6.25
4	5.55	4.35	7.20	4.50	3.50	5.75
5	5.80	4.70	7.90	4.75	3.50	6.00

District 1: Lassen, Modoc, Plumas, Shasta, Sierra, Siskiyou, Trinity.

District 2: Amador, Butte, Colusa, Del Norte, El Dorado, Glenn, Humboldt, Lake, Marin, Mendocino, Mono, Napa, Nevada, Placer, Sacramento, Solano, Sonoma, Sutter, Tehama, Yolo, Yuba.

District 3: Alameda, Contra Costa, Monterey, San Benito, San Luis Obispo, San Mateo, Santa Clara, Santa Cruz.

District 4: Alpine, Calaveras, Fresno, Kern, Kings, Madera, Mariposa, Merced, San Joaquin, Stanislaus, Tulare, Tuolumne.

District 5: Imperial, Inyo, Los Angeles, Orange, Riverside, San Bernardino, San Diego, Santa Barbara, Ventura.

HEADQUARTERS ESTABLISHED

The World's Dairy Congress Association has established headquarters at 426 Star Building, Eleventh and Pennsylvania Avenue, Washington, D. C., where H. E. Van Norman, president, will welcome callers and communications from any who are interested in plans for the coming congress.

WIND GENERATED ELECTRICITY

California in rich in hydro-electric possibilities and development is proceeding rapidly along that line. Many have often inquired why we could not develop the great power in Pacific tradewinds. It has been felt that in interior valleys this would not be possible, but many of the coast counties are still asking. Many scientists have done some experimenting with electric generating units driven by the wind and many devices have been tried. The early experiments all took the same trend, the power of the wind being transmitted to a generator placed directly under the tower. This again was connected to the wind wheel through a long vertical shaft and bevel gears. Other plants, too, were made on which a belt was placed on the rim of the wind wheel and around a generator pulley. With these a 14 foot wheel and a four inch pulley served to make the necessary reduction in speed. The long belt did not stand up under adverse weather conditions, so this, too, was a failure.

Under favorable wind conditions a single windmill often has capacity enough to light the home, barn and other buildings and will pump the water, operate the vacuum cleaner, electric iron, separator, washing machine and other time saving household helps.

MEN WE LIKE

The man we like
We will admit
Is one who reads
And thinks a bit.
Who doesn't think
So much of looks,
But knows the folks
Who live in books.

FEED IT

Millions of tons of forage will lose money to the growers this year unless fed to good livestock. Well-bred Shorthorn cattle will make a profit consuming the surplus forage and grain on any farm, and the farm will be the better for the fertility will be increased.

POULTRY

Baby Chicks—When you buy baby chicks the big thing for you to remember is QUALITY, in both the chick itself and the parent stock. By investigating you will find that our chicks are in a class by themselves; for we have absolutely the best equipment obtainable to produce them and very high class stock from which we get our eggs, and then, too, we know how to handle and deliver chicks. We are hatching every week White Leghorns and Anconas that will lay; R. I. Reds and Barred Rocks that are well bred and will produce. Send for our circular and prices and order immediately for 1922 delivery. ORANGE COUNTY HATCHERY, Santa Ana, California.

"It Pays to Buy the Best"

BABY CHICKS

Book your order with us now for early Spring Chix—from our own selected flock of 4000 birds. Order now and be sure of your chix. WHITE LEGHORNS ONLY—the Laying Strain.
STEELES' EGG RANCH,
Phone Gardena Exchange 692.

FARM LAND FOR SALE

WANT A BETTER PLACE TO FARM?
HERE IS YOUR OPPORTUNITY

Having more land under the Yuma Project (the best irrigation project in the world) than the reclamation law permits one owner to receive water for, am forced to dispose of several splendid farms. They will be sold quickly, extremely cheap, on terms to suit. This rare opportunity is worth prompt investigation by anyone wanting a better place to farm. Fertility of soil unexcelled, water unlimited, climate adapted to endless number of profitable crops. The banner alfalfa seed district of the entire country, home of the wonderful Hairy Peruvian variety, yielding almost unbelievable returns. Conditions ideal for dairying, hog raising, gardening, fruit growing. The good farmer cannot help making money on these lands. I will also sell under similar conditions a number of very valuable unimproved tracts in that portion of Yuma Project which constitutes the earliest and best citrus fruit and vineyard belt in the Union, immune from injurious frosts. You cannot afford to not look into this. Mulford Winsor, Ayrlawn, Yuma Valley, Yuma, Arizona.

READ THIS!

20 acres, 1½ miles from town, located on good county road.

10 acres in 5-yr.-old Thompson Seedless vines, all staked.

About 4 acres in 10-yr.-old almonds.

About 4 acres in 3-yr.-old almonds.

About 2 acres in drying yard and around buildings.

The house is small and can be used for temporary home until you build a permanent home. Beautiful shade trees where house will be built. Good well with enclosed tank house and windmill. Barn and hulling shed. Several fruit trees around buildings.

This place can be bought for $10,000. The vineyard alone is worth this much. Write us for complete set of photos of this place, if interested.

THE CALIFORNIA PLAN OF LIVESTOCK AUCTIONS

(Continued from Page 635.)

sale through by-bidding "directly or indirectly" will think twice before doing so if he is forced to pay the standard sale commission on the selling price and in addition run the risk of paying a penalty of 25 per cent of the price at which an animal is struck off.

The fact that during five years of operating under this plan there have been but few suspicious instances of by-bidding and no single case has been proved reflects the efficiency of the plan and the high standard maintained by California breeders. As a matter of fact the buying public has come to have utmost confidence in sales held under this plan, and the management, having the moral support of the leading breeders, has at all times counseled against such practices and let it be known that exposure would follow proof.

In the event a buyer feels that he has a claim against the seller "involving the accuracy of statements made by the consignor, the president of California Breeders' Sales and Pedigree Company is authorized to appoint a committee of three persons, and the decision of this committee shall be binding upon both seller and buyer, and if the consignor is in the wrong he agrees to pay the expense of adjustment; and the buyer agrees that if the above mentioned committee disallows his claim he will pay the expense of investigation."

During the past five years it has been necessary to appoint such a committee on but two occasions and in each case the committee was upheld—once by buyer and seller, and once by the court.

Another service rendered the buyer is the prompt forwarding of transfers and other papers. All such papers are sent to the sale manager at the time entry is made and following the sale are properly filled out and gotten to the buyer with as little delay as possible.

The provisions of the sale contract mentioned above are perhaps the more important features seeking to set up protection for the buyer — especially the beginner, and, so far as the writer knows, constitute the most advanced selling plan in operation in America. Certainly no general plan with which he is familiar offers as many safeguards, and the fact that all sales held by the central selling agency are conducted under those terms, thus establishing, practically speaking, a uniform and universal practice, has met with popular approval.

The relationship of the selling organization to the seller embraces equally meritorious features.

Under the California plan every breeder, large or small, has available an expert selling organization the services of which are available to each on absolutely the same terms. Each breeder electing to sell under the plan sells on the same basis. The advantage California breeders hold over their fellow breeders of other sections through having available expert sales service should be obvious. Selling is quite a distinct and separate operation from breeding. A man may have acquired an enviable reputation as a breeder, yet be almost helpless as a salesman. Under existing practices in the East, from the moment a man announces a public sale he is fair game for auctioneer, ring men and livestock advertising solicitors, who by pleasing personality, clever sales talk or open threats succeed in inducing the seller to assume an overhead expense entirely out of line with the value of his offering. The seller must attend to placing his advertising copy, preparing the catalog and the thousand and one other details incident to a sale. Likewise he must make his own warranties, selling terms, conduct all settlements and finally attend to all the papers of transfer and registration. In all too many cases this is more detail than the average seller has time to handle promptly or efficiently.

Under the California plan, a breeder, or a group of breeders, about to hold a sale, takes up the matter with the California selling organization. The manager visits the herd, looks over the cattle to be sold, discusses the conditions and from his extensive and intimate knowledge gives the owner an estimate of about what he can expect. If a sale is decided on, the seller makes his entries on the standard form—the same as other breeders use. From that moment he is relieved of any worry about details save to have the cattle in presentable condition at time of sale.

The selling organization having made an estimate as to the legitimate and probable worth of the offering, estimates the commission payments and from that estimate makes an appropriation for advertising in the press, publishing two-color folders to be sent to an extensive mailing list, the catalog, auctioneers, ring men, and other normal expenses. Having determined upon the outlay, the proper machinery is set in motion and kept going until the last transfer has been mailed—and even beyond that point, for at all times buyers have an opportunity to make complaints.

Just here is a good place to inquire into the practical results following five years' operation of the California plan. During the time mentioned, that organization has conducted 95 per cent of the registered cattle sales in this state, embracing over 6,000 head of registered cattle of the following breeds: Holstein, Herefords, Shorthorn, Jersey, Guernsey and Ayrshire.

The complete figures to the end of 1921 are not yet available but up to January 1, 1921, the sales include:

HOLSTEINS

	No. Head.	Sold for	Ave. per Head.
Females....	2592	$1,026,286.50	$399.65
Bulls.....	472	149,809.50	317.39
Total....	3065	$1,176,096.00	$383.71

JERSEYS

Females....	182	$ 37,745.00	$207.39
Bulls.....	22	2,600.00	118.18
Total....	204	$ 40,345.00	$197.77

HEREFORDS

Females....	315	$ 119,415.00	$379.09
Bulls.....	95	34,765.00	365.95
Total....	410	$ 154,180.00	$376.05

SHORTHORNS

Females....	286	$ 112,395.00	$392.98
Bulls.....	47	10,670.00	227.00
Total....	333	$ 123,065.00	$369.56

Adding to the above tabulation 46 registered Ayrshires, sold for $7,065, and 122 registered Holstein bulls sold in bull sales for $19,833.50, makes a grand total for the registered cattle of three dairy breeds and two beef breeds and by breeders through sales during four years, 4,180 head for a total price or $1,520,585, an average of $363.77.

During the first six months of 1921, 1,049 head of registered Holsteins (cows, heifers and bulls, many of them just calves and not a few sold as reactors) were sold for an average of $387.

The average sale commissions paid during the first four years is:

Holsteins, 8.87%.
Herefords, 8.5%.
Shorthorns, 9.1%.
Jerseys, 11.7%.

The relatively high commissions in the Shorthorn and Jersey sales are abnormal and are due to the fact in each breed one large herd was sold for a low average. No figures are available for other states and until such figures are presented there is no

GRAND CHAMPION HEIFER SOLD BY UNIVERSITY

Lula Mayflower, the cross bred Aberdeen-Angus heifer which won the title of grand champion at the International Livestock Show, has been sold at auction by the University of California. The price was $1.10 per pound according to G. H. True, professor of animal husbandry at the Universtiy of California.

Lula Mayflower was bred, fed and raised at the college of agriculture of the state university. At the time of the auction sale Lula Mayflower weighed 1,400 pounds. In addition to being made grand champion of the show Lula claims the distinction of being the first heifer to win such honors.

Healthy Happy Chicks

Are Assured With the

Reliable Brooder

New improved 1922 model.

Chicks will soon be hatching and you'll want them to be healthy and hardy. Keep them warm and comfortable.

The Reliable is the lowest priced quality brooder.

Burns kerosene (blue flame) on an oil level, without valves to clog. No fumes, smoke or gas, and no overflow of burner.

Simple and Sanitary
Easy to Regulate
Lots of Heat
Well Ventilated

Most Satisfactory Brooder on the Market

Three sizes:

30 inch..... 350 chicks or less
42 inch..... 500 chicks or less
52 inch.....1000 chicks or less

Final Report of Egg Laying Contest at Santa Cruz

By J. E. Dougherty

WITH an average yield of 244 eggs each the ten hustling layers belonging to Hanson's Poultry Farm of Corvallis, Oregon, won the contest and the silver loving cup, after a nip and tuck struggle in as fast company as ever was gathered at a contest of this kind. Second honors and a silver medal were taken by Geo. Gray of Santa Cruz, with an average 12 month production of 231.3 eggs, and the prize for third high pen went to S. L. Gibson's pen, average record for the year, 229.9 eggs each.

The highest individual record of 298 eggs for the 12 months was made by a Hollywood farm hen. Second honors were captured by Oregon agricultural college Barred Rock with a production of 287 and White Leghorn with a yield of 282 eggs. Nineteen hens laid over 260 eggs each, but Geo. Gray's pen, winner of second prize, was the only pen in which every hen produced better than 200 eggs. Seventeen of the 54 entries in the contest averaged over 200 eggs per hen, and 28 pens, or over 50 per cent of the pens entered, averaged better than 190 eggs per hen. 280 out of 540 competing hens averaged better than 190 eggs each. The average of the whole contest flock was 50.9 per cent or an average production of 186 eggs per hen. Does it pay to breed?

Production for October, the 12th month, was 28 per cent although the last few days showed that production was again on the up-grade.

Final standing of the 54 entries of 10 hens each for the contest year November 1, 1920 to October 31, 1921:

Pen Records

Hanson's Poultry Farm, Corvallis, Oregon, 2440 eggs; Geo. Gray, Santa Cruz, 2313; S. L. Gibson, Santa Cruz, 2299; W. H. Marshall, Santa Cruz, 2282; Hollywood Farm, Hollywood, Washington, 2204⅔; S. L. High Hens

High hens for 12 months: Hollywood Farm, 298 eggs; O. A. C. (Barred Rocks), 287; O. A. C., 282; Hanson, 279; Hanson, 278; Crewdson, 274; Kleinsmith (Barred Rocks), 271; Hollywood, 269; Hanson, 267; Hampton & Louckes, 266.

The fowls consumed approximately 41 pounds grain, 41 pounds mash, 3 pounds shell and .7 pounds grit per hen during the 365 days of the contest and used 22.4 pounds straw each.

All birds, unless otherwise noted, are S. C. White Leghorns. Fractional figures in pen records result from dividing floor eggs between the three entries in each pen.

Report from Annual Meeting of Poultry Producers of Central California

By General Manager J. H. Barber

The annual meeting of the stockholders of the association was held at the San Francisco office on Tuesday, November 29. Reports on the business of the association during the past year were made by President Denman and General Manager Barber.

The proposed amendment to the by-laws, changing the date of the annual meeting to the last Tuesday in January of each year, beginning with 1923, was carried by a unanimous vote.

Addresses were made by State Market Director Maddox and G. C. Keeney, manager of the Poultry Producers of San Diego, both of whom spoke forcefully and very interestingly on the importance of cooperative marketing to the producers of farm products.

Dr. Chas. K. Hale of Santa Cruz spoke in favor of having an annual convention of the poultrymen of the state, similar to the conventions that are held by the fruit growers, at which matters of general interest could be discussed. This is a matter worth thinking about. There is no doubt that such conventions, if well attended by the poultrymen, would result in considerable good to the industry.

The question of the association's taking up the packing and feeding of poultry this season came up for discussion. President Denman stated that in view of the fact that financial conditions were still very much unsettled it did not seem wise for the association to take on large additional financial responsibilities as would be the case if we undertook the handling of poultry at this time. Furthermore, the condition of the poultry market during the past year had been so bad and the losses by those who had stored poultry were so heavy that the present prospect was anything but encouraging. It would seem to be the part of wisdom to postpone action in this matter for another year. Directors Walls and Bergstedt also spoke forcefully to the same effect. It was the sense of the meeting that this matter should be left entirely to the discretion of the directors, and on motion unanimously carried the question was therefore laid on the table.

M. F. Heaney of Santa Rosa asked what the manager did to earn his salary. The question was answered by President Denman and ex-President Lyding, both of whom are well qualified to speak on this subject. The meeting closed with a vote of confidence in the directors and the management.

Immediately after the stockholders' meeting, the newly elected directors met at the call of President Denman and proceeded to organize. The following officers were unanimously elected for the ensuing year: President, J. R. Denman; first vice-president, D. B. Walls; second vice-president, J. J. Bergstedt; secretary, Geo. W. Wood; general manager, J. H. Barber; assistant manager, John Lawler; treasurer, Anglo & London Paris National; counsel, Sapiro & Levy.

The executive committee will consist of the following: President J. R. Denman, State Representative Haskell, General Manager Barber, Director Walls, Director Bergstedt.

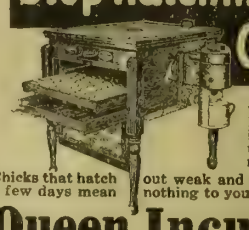
Stop Hatching Weak Chicks



with cheap incubators. Remember, it is not how many you hatch that counts but how many you raise.

Chicks that hatch a few days mean out weak and wobbly, and live but nothing to you but trouble and loss.

Queen Incubators

produce large hatches of strong, vigorous chicks that live and grow. The Queen is accurately regulated—taking care automatically without attention of a variation in temperature of 70 degrees without danger to the eggs. It is built of genuine Redwood—very scarce in these days of imitation. Redwood does not absorb the odor from hatching chicks. Cheaper woods and strawboard or composition lining in iron or tin machines, retain the odors, to weaken and kill the chicks of later hatches.

Queen Incubators and Brooders are sold by dealers everywhere. Send for Free Book. (42)

Kill the Rats
New Easy Way

Amazing Virus Gets Every One.
Safe to Use. Not a Poison

Rats, Mice, Gophers — in fact all Rodents can now be wiped out easily and quickly. Imperial Virus will do it. This new discovery is a fluid, true Virus. Entirely harmless to humans, poultry, stock, pets, etc.

Infects Rodents only. Greedily eaten on bait. Sets up burning fever. The pests communicate it to others, and all die outside, hunting air and water. Imperial Virus is put up in sealed bottles, thus insuring full strength and potency. Only safe, sanitary method to overcome these pests.

YOU CAN GET YOURS FREE

Here's how! Send $1.00 today (currency, M. O., Check, etc.) and we will ship you by return mail, postpaid, two regular, full sized (double strength) $1.00 bottles of Imperial Virus. Use one to rid your place of these pests, and sell the other to a neighbor, thus getting yours free. Special inducements to represent us.

If more convenient, send no money, just your name and address to Imperial Laboratories, Dept. 723, 2110 Grand Ave., Kansas City, Mo. Pay postman $1.00 and few cents postage when package containing two bottles arrive. Guaranteed to do the work to your entire satisfaction within 30 days, or your $1.00 will be cheerfully refunded.

dling poultry, it has been definitely decided by the board to postpone the handling of poultry for a year. While this may be a disappointment to some, I am sure that we will all agree that under present circumstances this is a wise decision.

STORRS EGG LAYING CONTEST

Storrs, Connecticut, November 22, 1921. Report for fourth week ending November 28, 1921.

Ice storms, rain, snow and continued cloudy weather do not stimulate egg production. The egg yield at Storrs last week was affected adversely, and the splendid start during the past month has been partly offset. The hens dropped a couple of dozen eggs behind the previous week's production and fell 20 eggs below the average for the last seven years. The total for all pens was 1385 eggs, or a yield of nearly 20 per cent. At the end of the first month there were two pens of barred Rocks, one of Columbian Rocks, three of White Rocks, one of White Wyandottes, and two of Rhode Island Reds which have not laid a single egg. Contrasted with these non-producing hens are 15 others that have laid more than 100 eggs each. Pullets are not of course expected in the beginning of their laying year to produce full size eggs. The fact is that during the first month their product will average from ten to 20 per cent under the standard two ounce eggs. There are, of course, exceptions to the rule. Three Rhode Island Red pullets laid last week eggs that average 36 ounces to the dozen instead of 21 or 22 ounce eggs as most of the birds are laying.

During the last week in November Charles H. Lane's pen of Rhode Island Reds from Southboro, Massachusetts, was in first place with a yield of 37 eggs.

The four leading pens in each of the principal breeds are as follows:

Plymouth Rocks

James F. Macdonald (White), 147; S. Bradford Allyn (White), 119; Merritt M. Clark (Barred), 87; Seven Hills Farm (Barred), 87.

White Wyandottes

Frank P. Matteson, 159; Benjamin F. Decker, 127; Woodbridge Orchards, 112; Clemens J. Diemand, 109.

Rhode Island Reds

The Orchards, 147; F. S. Chapin, 139; F. H. Sampson, 135; Pinecrest Orchards, 135.

White Leghorns

Small's Poultry Farm, 122; Meadowedge Farm, 114; Goshen Poultry Club, 111; L. E. Ingoldsby, 97.

CALIFORNIA FARM BUREAU EGG LAYING CONTEST

High pens, November 20 to December 1: H. H. Corbett, Santa Cruz, 75 eggs; Alex Stewart, Santa Cruz, 70; J. J. Shore, Santa Cruz, 70; Piper's Poultry Place, Santa Cruz, 59; Warren Wood, Santa Cruz, 55; Hanson's Poultry Farm, Corvallis, Oregon, 55; W. J. Neef, Santa Cruz, 54; Seabreeze Poultry Farm, Capitola, 52; Sunrise Poultry Farm, Santa Cruz, 50.

GUINEAS VS. HAWKS AND RATS

A Cultivator correspondent asks how to prevent hawks taking chickens. By keeping a few guinea fowl with his flock he may discourage and possibly prevent further hawk visits. If there are rats about the place they will move over to the nearest neighbor's ranch. Guineas are good fighters. I have known a man caught taking eggs out of their nests to have one fly 50 yards and hit him in the face like a baseball, leaving a mark where its breastbone hit him. Their "Buckwheat, Buck-wheat" song is pleasant to hear, and when a hawk comes they have another alarm call that will tell the owner, if he is a mile away, that there is a fight on.

Poultry Queries

Conducted by Jean A. Koethen

Beet Pulp for Chickens

Please inform me if beet pulp fed to chickens is injurious or beneficial, or if it has any value as greed feed.—Subscriber, Morgan Hill.

According to Professor Jaffa's table dried beet pulp is 53 per cent starch and sugar and 25 per cent crude fiber, less than 10 per cent water and less than 3 per cent ash. This marks it as a fattening feed and one valuable for adding bulk to the ration, but maize and milo are better when fat is desired, and alfalfa meal contains protein and more fiber.

To Fatten Geese

What would make a good fattening ration for geese confined in a pen?—Subscriber, Chino.

The Cornell ration for fattening chickens is quite as good for geese: 50 pounds cornmeal, 20 pounds wheat middlings, 10 pounds ground oats. Mix to a batter fresh at each meal with buttermilk or skim milk. If milk is not available add 20 pounds meat scrap to the ground grain.

Scaly Leg

Some of my White Leghorns have scabby legs. What is the cause and how can it be cured?—Subscriber, Highland.

Scaly leg, as this scabby condition is called, is caused by a mite which burrows under the epidermis and throws up heaps of scales. It is quite contagious and is passed quickly through an entire flock when once it has entered it, but the underlying cause is always the same—filth. Scaly leg is rarely seen in yards that are kept clean and houses from which the droppings are carried regularly, hence thorough cleanliness is the one preventive measure. To cure the affected birds an ointment made of one part oil of caraway to five parts white vaseline rubbed into leg and foot every few days is the best remedy. A cheaper remedy and one more adapted to use in a large flock is one part kerosene to two parts raw linseed oil. This may be rubbed on the leg and foot or the birds may be taken from the roost at night and their legs dipped in the mixture for a moment. In using kerosene remember it will burn if it is allowed to touch the feathers.

For More Eggs

We have 800 Anconas on free range but are not getting a good egg yield. We keep millrun moistened with curd and whey before them in troughs all the time, also rolled barley in troughs, and feed white corn at night. How can I improve this ration?—Subscriber, Tulare.

Your ration is too fattening. Instead of the millrun, keep a good commercial mash dry in hoppers before your hens, and give them at night a scratch mixture of two-thirds wheat and one-third corn or one-half wheat, one-fourth corn and one-fourth barley, allowing not more than a quart daily for 15 hens. If you wish to use a moist mash in addition, moisten the same mash at noon with sour milk and feed just what the birds will clean up in a half hour. They have been getting too much grain, which is itself fattening, and too much corn, which is also very fattening, without sufficient mash to balance the grain. You may have to shut up your birds in order to get the best egg yield. The value of free range depends a good deal on the character of the range. Most commercial poultrymen believe their hens do better when they are confined.

Alfalfa Leaves

Are alfalfa leaves thoroughly soaked in water good for laying hens?—Subscriber.

Valencias, market pack, 3.00@4.50, according to size and quality. All varieties culls, field boxes, 2.00@2.50. Tangerines: Demand and movement good; best, 12@13 lb.

HONEY

Honey movement in the past two weeks has been comparatively light and demand has fallen off to some extent. Prices remain practically unchanged and the light supplies on hand are likely to prevent any weakening in the immediate future. Some 1920 sage still remains on hand, but everything else now being shipped is of the 1921 crop. The supply is gradually cleaning up and little honey is expected to be available by January except mixed cars of goods in glass and tin containers and straight cars of honey in two and five pound glass jars. Car lot prices, per pound, f. o. b. loading stations: White sage, 11; light amber sage, 8; light amber alfalfa, 6½@6¾; white orange blossom is nominally 12@12½ per lb., but straight carloads are unavailable except by combining small lot offerings. Beekeepers are being paid 6@6½ per lb. for light amber alfalfa, and there is said to be more business in this grade than in any other California honey. Car lots of Hawaiian honey are quoted f. o. b. San Francisco: White, 6; light amber, 5½; honeydew honey, 4. Both inquiry and movement of Hawaiian stock are reported to be moderate.
Beeswax is practically at a standstill, a few small lots being sold at 20@25 per lb., depending upon purity of the wax and its color. On account of foreign importations eastern demand for California wax is negligible. Many beekeepers have opened up substantial outlets for their supplies through roadside stands, and an increasing quantity of honey is being disposed of in this way each year. The average roadside price for light amber honey is around 50 cents per quart can.

GRAIN AND FEEDS

Grain Exch. price bid Dec. 13:
Barley: 100 ton lots, Dec. del., 1.37.
Milo: 100 ton lots, Jan. del., 1.30.

HAY

Alfalfa Growers of California report:
Market continued strong in all parts of the state and prices showed a further moderate advance. There is no change in the underlying situation, excepting that the factors of a limited production of marketing hay and of diminishing supplies in the hands of users, dealers and growers are making themselves felt more as the winter season advances. The lack of rainfall so far increases the current consumption to some extent, but has as yet not become a serious factor, as there is still ample time for plenty of rain. An outstanding feature of the present situation is that those producing and shipping districts which also have a considerable local market have ceased shipping to central markets, as growers have no trouble in selling f. o. b. ranch at from $3 to $6 a ton above central markets. There were 990 tons of grain and alfalfa hay received on the Los Angeles tracks the week ending December 10, with 90 tons held over.
Prevailing prices last week, delivered in the vicinity of Los Angeles:

No. 1 dairy alfalfa	23.00
Standard	18.00

Quotations by Nichols-Loomis Company. Following are prices to growers f. o. b. Los Angeles in carload lots; handling and commission must be added to obtain retail prices on new hay:

Tame Oats	22.00@28.00
Barley	18.00@24.00
Alfalfa, Rabbit	24.00@28.00
Alfalfa, No. 1 Dairy	20.00@22.00
Standard	16.00@18.00
Straw	12.00

$6.00 Barley Seed for $3.00 per hundred

The Heavy Yielding "4000" Variety
That Withstands Drouth

If you raise barley, why not plant at least a little "4000" and improve your seed? You can also sell it for seed. It has proven to be around 20 per cent better than ordinary barley. Plump, heavy kernels insure good germination. It weathered a hard dry spell last year and came out vigorously. Seed cost $6.00; we sell it for $3.00 per hundred sacked F. O. B. Alpaugh.

J. W. McClarren — Alpaugh, Calif.

to the farmer, while the prices quoted by the newspapers are off cars at their packing houses.

POTATOES AND ONIONS

Oranges: Valencias, nominal. Lemons, 3.00@4.50 per box; lemonettes, 1.50@3.00 per box. Grapefruit: 2.50@3.50 per box for California and Arizona. New crop Navels, 4.50@5.50; do, choice, 4.00@4.50. Mandarins: Box, 2.50@3.00.

HONEY

Demand has been better and movement heavier during last two weeks. Market firm, better feeling. Stocks continue to decrease. The heaviest movement is on light amber alfalfa; supplies of other grades, especially white stock, limited. Due to late rains, colonies in Southern California have more brood than usual at this date, and as a result winter stores are being consumed too rapidly. Carloads f. o. b. usual terms at loading points: White orange, no sales reported, supplies nearly exhausted; white sage, mostly 11½; light amber sage, 8½; light amber alfalfa, 6½@7, mostly 6½. Considerable California honey being sold by producers in small lots at prices averaging 3@7 per lb. higher than carload prices. Hawaiian carloads, f. o. b. San Francisco: White, 6½; light amber, 5; honeydew, 4. Beeswax: Quiet. Too few sales to establish market.

BEANS

Chinese peanuts, fy., 10.
Pecans, 25.

HAY AND FEED

California Alfalfa Growers report:
Prevailing prices last week, f. o. b. San Francisco:

No. 1 Dairy Alfalfa	16.00
Standard	15.00

A. W. Scott Co. says:
Receipts past week, 522 tons. Stocks in yards and warehouses in San Francisco are light; indications are that the market will continue steady and values strongly maintained. Interior trade has been much better as the cold weather following the rain has been unfavorable to the ranges and the demand has strengthened considerably in every direction. Better grades of hay seem to be desired, particularly where the length of the shipment incurs high freight rates. Alfalfa is in active demand.
We quote today wholesale prices in carload lots as appear from dealers' transfers upon the markets in San Francisco (for prices to consumers, charges of switching, cartage, commission and handling expenses must be added, according to conditions).

Wheat hay No. 1	17.00@19.00
Wheat hay, fair grade	14.00@17.00

Citrus Markets

Los Angeles, December 14, 1921.

New crop Navels are meeting a strong demand and are commanding very satisfactory prices. Some wind injured fruit is being shipped but not in sufficient quantity to materially affect market. F. O. B. quotations are around $3 to $3.50.
Lemons are meeting with limited demand and are commanding prices such as are not highly satisfactory to growers.

Shipments

Shipments of citrus fruits to date since November 1, 1921, Southern California: Oranges, 751 cars; lemons, 558; total, 1,309. To same date last season: Oranges, 929; lemons, 483; total, 1,412. From Central California to date this season: Oranges, 2,906; lemons, 13; total, 2,919. To same date last season: Oranges, 2,835; lemons, 27; total, 2,862. From Northern California to date this season: Oranges, 269; lemons, 2; total, 271. To same date last season: Oranges, 248; lemons, 1; total, 249.

CALIFORNIA CATTLEMEN'S MARKET REPORT

San Francisco, December 5: Receipts at Chicago past week decreased materially, with very slight decrease in price. Receipts in San Francisco showed considerable decrease with steady price and strong demand. Strong demand still exists for all classes of stock.
Stock and feeder cattle are exceedingly short in California, and Nevada reports that practically all available stock has either been sold or is now on feed in that state.
Information received from the Middlewest is to the effect that there are probably 10 per cent less cattle on feed in that section than normally, but indications are that more cattle will be put on feed and that a considerable number have stopped en route for feeding at points a little farther west. The Middlewest seems to show a considerable decrease in number of sheep on hand and being fed. Information from the Northwest is to the effect that there is a considerable supply of Canadian cattle being fed, but the total number on feed at the present time is about normal and not in excess of last year.
Sales are reported about the same as last week, being 6½c in the valleys of California, with the bulk of sales at 5¾c in the northern and eastern part of the state. Some few sales are reported for higher figures. San Francisco buyers are contracting in Nevada for 6½c f. o. b. cars for delivery in March and April.
We regret that since our last report announcing that a 10 per cent reduction in railroad rates would become effective on December 1st, the whole matter has again gone before the interstate commerce commission for another hearing and the rate probably will not go into effect until January 1. A strong effort is being made to secure this 10 per cent reduction on short hauls, as well as to extend the 20 per cent reduction on long hauls.—R. M. Hagen, Secretary.

WEATHER REPORT

San Francisco, Dec. 10, 1921.

POULTRY QUERIES

(Continued on Page 641.)

All hens are fond of dry alfalfa leaves and they are good feed, but why soak them? No amount of water will make green feed of them and you have your trouble for nothing.

Sour Milk

Is milk which is sour but not clabbered apt to stop hens laying?—Subscriber.

Milk in any form is one of the most valuable feeds a hen can have and will help her to manufacture more eggs, but I think most hens like clabbered milk better than milk which is not clabbered, perhaps because it is more easily eaten. If the milk is used for moistening a mash it makes little difference whether it is sour or sweet, thin or clabbered.

Capons

Can you give me information in regard to capons? Does the market call for a large quantity and what is the average market price?—Subscriber, San Bernardino.

The capon market, I am told by breeders who have tried it, is not very reliable. If one can market his birds at retail prices in his own neighborhood or sell to clubs or restaurants on contract there is a good deal of profit in it, but if one must trust to selling through a commission merchant when his birds are ready there is apt to be disappointment. The capon market, like the squab market, is not well developed because the supply of capons is never large and always fluctuating, and possible customers, when they ask for capons and capons are not forthcoming, content themselves with hens or soft roasters and forget about capons. The price is a little greater than that paid for soft roasters, possibly 5 cents a pound more on the average, but this hardly pays for the extra months capons must be fed. The time will come, of course, when capons will be in as great demand in California as they are in the East, and that time will be hastened by an increase in capon production. It is worth while for the family table if for nothing else.

CALIFORNIA PLAN OF LIVESTOCK AUCTIONS

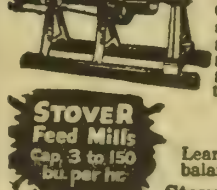
(Continued from Page 639.)

ground for disputing the statement that California breeders have been provided with a high class sales service, netting them average prices not surpassed in other sections and at the lowest selling cost in America.
In accomplishing the above results, no single case of by-bidding has been proved—and but a few suspected.
In four years' time but two bidders have defaulted in paying for their purchases and in each instance steps have been taken to prevent repetition on the part of the same buyers.
As stated before, only two occasions have arisen for the appointment of committees to adjust complaints.
Not the least of the service rendered sellers has been the prompt settlement of the financial details of sales. As a usual thing complete settlement is made within 24 hours.
As stated in a former article, at the time of organization it was unanimously agreed among the directors that the operations of the company would be directed strictly to the best service possible to render the breeders in its field, that no one of them would expect profit, salary or any other remuneration from the operations of the company, and that if any surplus should accrue it would be so handled as to benefit all breeders in its field.
That policy has been strictly adhered to. During the course of four years of operation a modest surplus sufficient to render the company stable and sound was accumulated, and January 1, 1921, a public announcement was made that from that time forward there will be refunded to the breeders selling through the organization the net surplus realized during each calendar year, said surplus to be prorated according to the amount of commission each breeder paid. The company's books for 1921 have not been closed at the time this is written, but it is understood that the refund will amount to at least one per cent of the commissions paid. Such a refund will further reduce the cost of selling to the breeders.
Ever alert to extend service to California breeders, the California Breeders' Sales and Pedigree Company, in March, 1921, reorganized in such a way as to be permitted under the California law to conduct a financial department for the financing of sales. At the time of the change an opportunity was extended various breeders to make investment.
The loan feature of the business has now been in force for about ten months, during which time the company has been able to extend liberal credit to men of moderate means who evidenced a desire to enter the pure bred business. This feature has also enabled the company to relieve the seller of any burden attached to carrying notes received in sale.
If measured by protection and service furnished the buyer or by satisfactory prices and low selling costs afforded the seller, or by well directed effort to extend in a sound and legitimate manner the influence of better livestock, it would appear that the California Breeders' Sales and Pedigree Company has justified the support California breeders have accorded it. Likewise, it would appear that no man or set of men, no paper or group of papers could fail to be impressed with the merit of this plan of selling over the more common practices prevalent in other sections—yet it is a fact that numerous attempts have been made to discredit the plan. Some of the methods resorted to have been assinine in conception and contemptible in attempted execution. Some of these activities will be discussed in a later issue.

Ranchers Plan Field Meets

Lower the Cost and Increase Production per Acre

A series of field meets is now being held throughout Southern California, following similar meetings held successfully by the ranchers of the northern part of the state. Fourteen or fifteen such field meetings already have been arranged from Camarillo on the north to Chula Vista on the south and other meetings will probably be arranged by ranchers in many sections as soon as the successful results of these meetings become known.
The plan of the meetings is to make an intensive study of the problems and conditions of each district and by study and discussion to overcome the peculiar conditions of soil and climate.
Among the different Los Angeles firms, who have assisted at these field meetings, the service department of the Dixon & Griswold Co., 130 No. Los Angeles Street, Los Angeles, have been conspicuous. Their La Crosse Orchard Disc and Mold Board Plows, which were designed in California especially to meet California conditions and which are, in fact, the ideas of prominent California growers, have been in almost daily evidence.
As the result of the series of field meets throughout the state it is expected that costs will be reduced and the production per acre of California ranches will be materially increased.
Ranchers who would desire to attend the meets or who are interested in the new La Crosse Orchard Disc Plow will be given dates and locations of the meets and descriptive circulars of the La Crosse Plows upon application by postcard to Dixon & Griswold Co., 130 No. Los Angeles Street, Los Angeles, California

STOVER


Grinding Saves Grain
Ground feed makes better stock—saves 25% of the grain. Stover Feedmills grind any grain to any degree of fineness. ½ H. P. to 40 H. P. capacity.

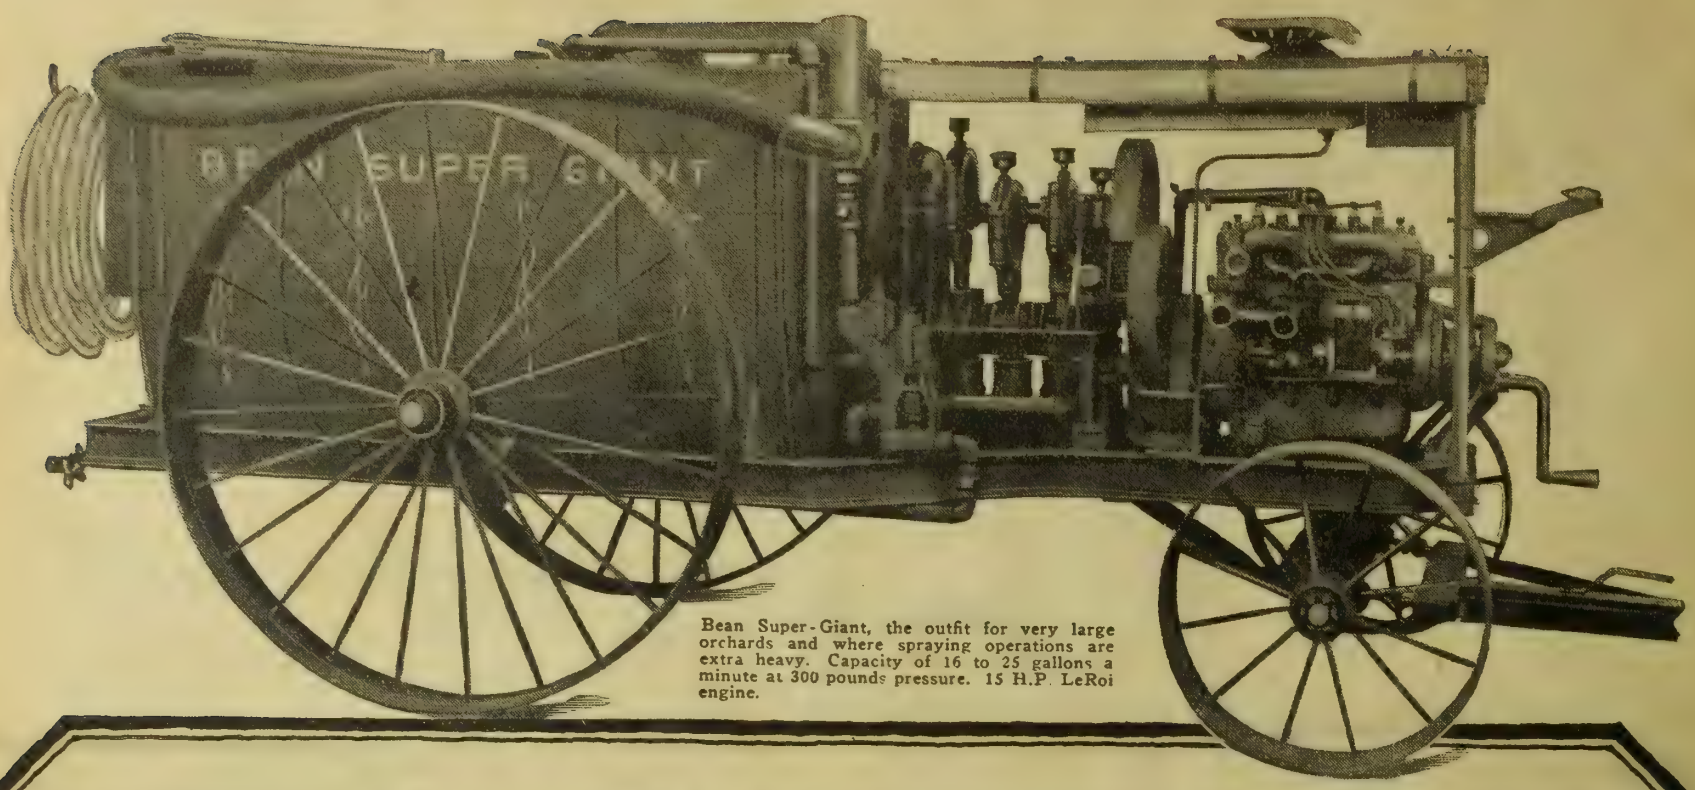
DEALERS EVERYWHERE



Bean Super-Giant, the outfit for very large orchards and where spraying operations are extra heavy. Capacity of 16 to 25 gallons a minute at 300 pounds pressure. 15 H.P. LeRoi engine.

Insure Your 1922 Crop with a "BEAN"

There's money ahead for the grower who takes good care of his trees. Thorough and energetic spraying is the only safeguard against tree diseases that reduce the crop, result in inferior fruit, and even kill the trees, if permitted to run their course unchecked. Adequate spraying equipment is vital. Makeshift outfits and old type rigs with insufficient pressure and too limited capacity will not do. You need a sprayer that will cover your orchard quickly and effectively with the least trouble and expense. In brief,

You Need a "Bean"

While retaining all the sturdy, dependable features which have made the Bean line famous, several important improvements have been made this year, including the Bean 6 H. P. engine, which is used on all our larger outfits with the exception of the Super-Giant, which has the LeRoi 15 H. P. engine. The Bean engine is the latest and best production of Mr. E. B. Cushman, noted as a designer of good engines.

Bean Troubleless Ball Valves

Bean Threadless Ball Valves can be opened up entirely and every part removed in less than two minutes. This is done without lowering the pressure, stopping the engine, or drawing the liquid from the pump.

Porcelain-Lined Cylinders

Used on Bean Sprayers since 1886 and proven to be the correct solution to the problem of long-wearing cylinder lining. These cylinders never need replacing under three or four years, and we have known them to wear for fifteen.

The Bean Pressure Regulator

The biggest single feature of the Bean line. It holds the pressure exactly where you want it, saves fuel in the engine, and wear and tear on the pump, and is absolutely safe and dependable. Fully described in our new catalog.

One-Piece Steel Bedplate

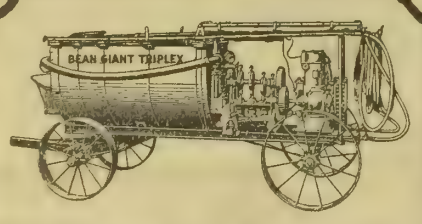
The Bean is the only outfit built today with a steel bedplate made in one piece, without wood floor. Every bolt from the engine, pump, and tank is secured to this frame, thus insuring the utmost rigidity. H. A. Watkins of Fruita, Colo., has just written us as follows: "I never knew my Bean to stop running when crossing creases as some others do. My rig runs absolutely without trouble."

Only Pump Without a Stuffing Box

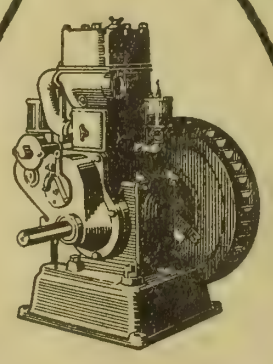
No stuffing box on a Bean pump, therefore no stuffing-box troubles. The cup-shaped molded plunger, an exclusive Bean feature, is held so close to the porcelain lining of the cylinder on the downstroke that no packing box is necessary. Less friction, too, on the upstroke.

Many Other Important Advantages

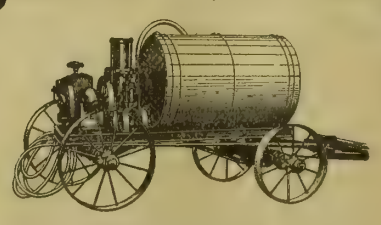
Get the new Bean Catalog, which illustrates and describes the entire Bean line from the mighty Bean Super-Giant, shown above, with its capacity of 16 to 25 gallons a minute at 300 pounds pressure right down to the little Bean Simplicity, the most popular little rig known to the fruit-growing world. Sign and send the coupon for your copy of the catalog.



Bean Giant Triplex, Outfit 629. Capacity of 12 gallons a minute at 300 pounds pressure. 200-gal. tank. Equipped with new Bean 6 H.P. engine.



Bean 6 H.P. engine, a lightweight, compact, self-contained engine, especially adapted to sprayer work. Runs surprisingly free from vibration, even under full power Standard equipment on our larger rigs. Can also be furnished to replace the engine on your old sprayer.



Bean Simplicity, Outfit 604. A handy, compact power rig for the small grower. Capacity 4¾ gallons a minute at high pressure. Can also be had without truck.

OUR ADVERTISERS RELIABLE

We guarantee our subscribers against loss through dishonesty of any advertiser in the Cultivator. We do not attempt, however, to adjust trifling differences between subscribers and honest, responsible advertisers, nor will we pay the debts of honest bankrupts. Notice of complaint must be sent us within 30 days from date of the transaction, and the subscriber must have mentioned the Cultivator when writing the advertiser.

Cultivator's weekly circulation If among the more than 40,000 any fail to find any article they desire to purchase advertised in the Cultivator's columns, a special request is extended you to let your wants be known to the California Cultivator and we will place you in touch with proper parties.

EDITORIALETTES

The cover hardly speaks for itself, at least not until the reader has thought a few minutes and perhaps read the article which appears on the opposite page. The idea in producing a cover illustration like that is to create an interest in the real literature which appears on nearly every page of the California Cultivator every week.

* * *

It is probable that Secretary of Commerce Hoover is about the most versatile and about the busiest man in President Harding's cabinet. Now he tackles another job, having been appointed government representative on the Interstate Colorado River Commission. A portion of the seven states have appointed their commissioners; let the rest get in line. Hoover is the kind that gets action. Let's Hooverize the Colorado.

* * *

It is raining. It seems to be the same kind that Noah prepared for, and a lot of Californians have either had to proceed as Noah did or else wade, and at present writing the clouds indicate that the wading will continue for some time. Many bridges have been washed away and occasionally damage has been visited upon farming lands, but as a rule farmers are possessed of one great happiness because of the drouth broken. It has been a general coast rain, thoroughly soaking from Rainier to San Diego. The precipitation at Mt. Wilson has reached nearly a score of inches. In producing sections it has varied greatly, ranging upward from two inches.

* * *

Los Angeles County flood control measures have served most admirably and the damage which in former years was great because of such a storm will be vastly lessened. Especially effective has been the Devil's Gate dam, which for the first time has impounded the flood waters and created an inland lake.

* * *

Nowadays we have an association for nearly every activity. If it hadn't been for this rain it is very probable we could have had an association for the promotion of a movement to secure greater precipitation. This would, of course, result in a special Rain Week, to supplement some of the "Weeks" we have been having for more perfect packages, fewer accidents, more raisins, cherries, oranges, olives and onions. These special days and weeks which we observe are all right. We fully endorse them, and as a further suggestion, how about giving us a rest week?

* * *

War taxes are going to be reduced on January 1, 1922. Some will be eliminated entirely. We will probably never get back to the 1914 basis, but it is certainly encouraging to know that our soda water and a few other things are to be exempt.

* * *

An Eastern exchange suggests: "It pays to warm up the drinking water for the dairy cow." What an awful shock it would be to California cows to see any such suggestion. However, the Easterner takes the matter quite seriously and suggests: "The ordinary tank heater used for warming water for the house is excellent for the purpose, and for fuel there are cobs, wood, or good old yellow corn."

MERRY CHRISTMAS

Peace on earth and good will to men seems nearer than ever before. With the conference in Washington and the world longing for opportunity to recover from the awful struggle, we hope that the "good tidings of great joy which shall be to all people" may yet be heard. California fields have been so wonderfully blest that there is at home a feeling of relief and even of happiness. The Cultivator wishes for every one of its readers the merriest and happiest of Holiday seasons.

COOPERATIVE STORAGE

One outstanding lesson of the past year is necessity of storage facilities and capital sufficient to hold crops from low markets. To a greater degree than elsewhere California growers through cooperative effort can store their crops. There are many associations with warehouses sufficient to store the crops of their members, but there are numerous crops in California that when produced must be sold immediately because the producer has no storage facilities. Speculators have taken advantage of this condition since time was. Usually wheat, barley, corn, alfalfa, beans and similar crops are lowest in price at the flood tide of harvesting or threshing. Many farmers must sell. After the rush is over, and the world's supply and demand is known, prices are usually better. Those who can store and hold crops receive the better prices. Those who are forced to sell early many times sell at an actual loss on cost of production. It would seem then that conditions would be more generally equalized if more storage facilities were provided. Elevators, warehouses, cooperative cold storage and packing plants owned by the producers will do more to do away with speculators than will legislation.

Let us resolve for 1922 to surround ourselves on these thousands of wonderfully productive California farms with buildings and similar facilities that will enable us to make the most of our labors.

MORE HOMES NEEDED

The year 1922 gives promise of being the greatest year of construction in the history of California. The year 1921 so far as records on building permits are concerned indicates that the past year has set a new record in both number and total value of buildings constructed. But early in the year labor was not available, and during the year several strikes among seamen who bring lumber by boat from the Northwest curtailed the supply of building material. Thousands withheld building operations waiting for lower prices. A building trades strike in the Bay district hampered operations in that section. Now it would seem we are fairly on our way to overcome the shortage of homes caused by the cessation of building during the war.

It is to be regretted that building permits cannot be registered in small cities and country districts so that actual conditions can be recorded. Only in the large cities have we accurate records of construction work. In the city of Los Angeles building activities during the year have exceeded those of any other year in the history of the city.

Pausing a moment, we ask why is there so much construction work at this time? There are reasons on every hand. First, California's population has increased 1,049,312 in the past ten years, filling all vacant properties and all that could be built. It is stated on good authority that the buildings being constructed now are not exceeding the requirements of the increased population. From all over the United States people are coming to California. Its fame increases from year to year as people who come here to live write back to their home folks to come and share in the climatic riches and fortunes of the Golden State.

And when they come it means more homes, more apartments, more bungalows, more farms and more population.

This increasing population insures the value of properties. Construct a home, and if you cannot occupy it there are others who will be glad to purchase it or pay a rental that will insure a good return on the investment. The demand for homes brought about by the increasing population in California makes an investment in a home a most wise investment.

A MODERN FARM

A California farm home may be possessed of all the advantages of city conveniences and avoid the inconveniences. Living in the hubbub and turmoil and traffic of the big city is driving, or rather alluring, many well-to-do city men to the country. They go to the country for the freedom they can enjoy and stay there because of it and because they can enjoy in the country home all the so-called modern conveniences. Our grandfathers sawed their own wood and many of them dug their own coal. Conveniences then consisted of a fireplace, some tubs, a baseburner, maybe a coal bucket. There is scarcely a person who reads this but has thawed out a pump back East to start the day's proceedings.

Contrast this with our thousands of modern California farm homes. Available now are running water in the homes, electric lights, either from current or the very efficient home lighting systems that have become so popular, furnaces, gas, wood, coal and oil heaters of all kinds, the automobile that takes one quickly to and from trading centers, churches, schools and gatherings, and all the new devices that make life the more enjoyable.

What have all these modern conveniences to do with our country life in America? This one big fact is apparent: Where a decade ago the tendency was to farm only because it offered a remuneration for hard work, and farmers quit farming by the thousands as soon as they were financially able to do so, moving to town to retire, now the tendency is more to appreciate a farm and a home in the country. The business of farming is succeeding the drudgery of farming. Inventive genius realizes the tremendous market in 54 per cent of all the homes in America—farm homes—and skill and genius have given the farm home all the comforts of the city dwelling.

The automobile is without doubt the greatest convenience of the farm. Power from gas engines applied to the dynamo gives light and electric current, water under pressure and power for the electric washer, the electric iron, the electric fan, the sewing machine, the cream separator—everything. The only reason more people do not have good farms and good farm homes is because they are poor and have to live in a big crowded city.

The day is coming when there won't be farms enough to go around in this great state of California. If you have one, keep it. Make it just as comfortable as you can and as profitable. If you haven't one, get one if possible. Indications are that they never can be secured for less money than now and no doubt will cost more. Build your home on a California farm for permanent comfort and satisfaction.

Uppermost in the minds of the publishers is the desire to give to each subscriber a full dollar's worth of information in each week's issue, regardless of the yearly subscription price of the California Cultivator. Suggestions from subscribers along the line of articles desired published are always welcome. The Cultivator guarantees the reliability of its advertisers and each of the advertisements contains valuable information that should be made use of by every reader. Advertisers are willing to give further information on request where California Cultivator is mentioned.—Business Office.

California Cultivator

Vol. LVII, No. 26 | Los Angeles, December 24, 1921 | One Dollar Yearly

Make the Farm House a Real Farm Home

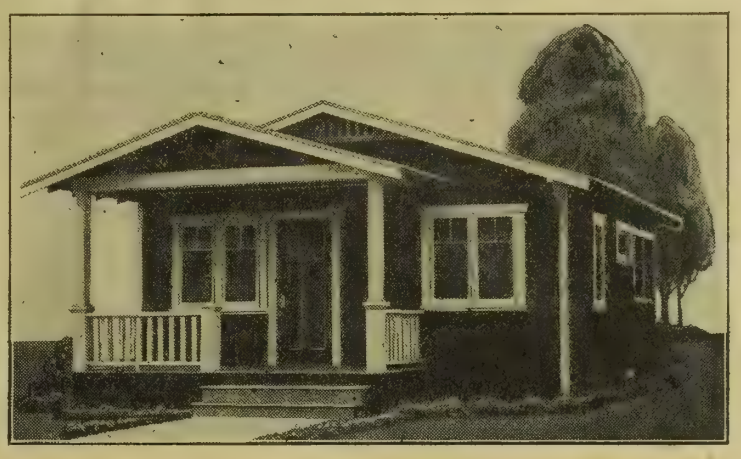
THE time is past when the farm home is a crude and illy built affair while on the same farm there are great fine barns and stables for the livestock. This does not mean that the money making end of the farm is less efficiently equipped, but it does mean that home efficiency and home atmosphere have improved. And the whole movement has been a money making movement. It is possible this step forward has been more pronounced in California than in Middle Western states for certainly California homes are well built, artistically designed and efficiently equipped. From necessity the pioneer felled the forest trees or, in the language of the day, made a "slashing" which after months or perhaps years was burned off and crops planted. The pioneer in California rarely has necessity for the removal of forest trees, but he sometimes confronts desert and other conditions calling for equally as strenuous a life. Under such conditions existence is the prime factor, and comforts come only after years of work.

Still, pioneering today, even in the reclamation of the desert, does not require, or at least should not, such sacrifices as did the pioneering of a few generations ago, for today with good roads, the telephone, the conveniences which come from hydro-electric power and light delivered in nearly all sections of the state, the comforts of an up-to-date urban community are found in many desert sections.

It's worth while occasionally to stop and take stock of our blessings, hence this week we refer at some length to the comforts and necessities of a California home as they have been often touched upon in an advertising way in the columns of this paper during the past few months. So we refer first to the cover, a hodgepodge of nothing at first appearance, yet, more carefully looking it over, seen to be made up of catch phrases from Cultivator advertisements which call attention to many a home comfort which is today becoming a home necessity.

We hope that page will call attention to the excellent reading matter in advertisements. Some of the most instructive and interesting and valuable reading matter in the papers and magazines today is that which is ordinarily termed advertising. Americans have become readers of advertising, and we believe it is to their profit. The per capita consumption of California fruits is safely double that of a decade ago, and this because of advertising campaigns inaugurated and persisted in. On the other hand the homes of California fruit growers have been made more livable and filled with comforts because of the appeal made in advertisements of manufacturers and dealers in those things which go to make for comfort and efficiency.

Not to give a list, but merely to mention some of the comforts, there is music. Of course, the proper place to begin enumerating would be the foundation, but we believe we are justified in suggesting that the bride and groom of today in planning for a new home, even in a remote portion of the desert, will begin with those things which the former generation would consider entirely non-essential. The bride of today wants it understood that she will not participate in hardships such as were endured by her mother who, while her husband was doing his best to reclaim the desert under most adverse circumstances, would go out and gather mesquite or greasewood in order to get out the week's family wash. So in planning for the new home she insists that some of the brighter things shall be hers, the phonograph, or the piano or



at least some of the so-called luxuries —and she gets them. In the more humble of homes today it is the exception to find one into which real music does not enter.

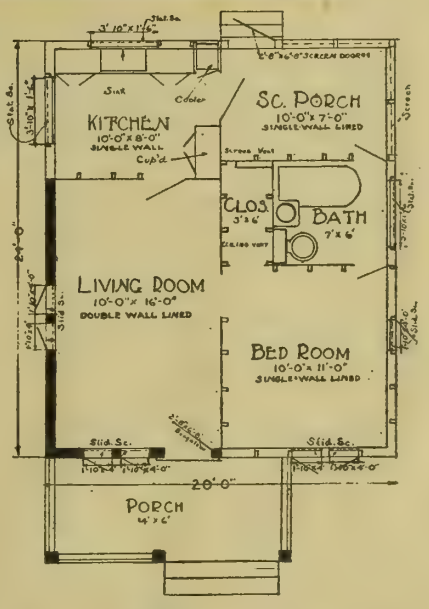
But to proceed in a more orderly way—to begin with the foundation. Mudsills formerly sufficed; today it's brick or concrete, and concrete with present day prices of cement isn't so expensive but it should be under every home. Its dependability has been proven through its use for lining in irrigation canals, for irrigation pipes, stable floors, silos, milk houses and all over the farm, and now we are getting it under our houses. Some have gone so far as to construct the entire home of it, even to the roof, but this is perhaps more expensive than the usual frame construction, and for that California offers lumber at prices and of such quality that no other section can excel us. In this connection it may be well to remember that high priced labor is not essential to concrete construction. Cement makers have supplied us with such complete directions and specifications that our concrete, mixed with a liberal supply of common sense, makes possible construction by the farmer himself.

After the foundation is in and before the frame goes up, attention should be given to the plumbing, and if not possible to carry to completion the plumbing it should at least be roughed in with an idea as to future needs.

Cesspools, septic tanks or even deeply laid drainage pipes carrying to distant portions of the place enable the farm to have all the plumbing conveniences possessed by the sewered city. All we can say regarding the conveniences to be added to the farm home in the form of up-to-date plumbing has been well said in many an advertisement appearing in the Cultivator during the past six months.

As to plans, it is possible today to buy ready made houses. We would not deny to every home maker the pleasure—one of the greatest in life—of planning the home according to cherished ideals and making the dreams come true, but fortunately the ready made house folks are supplied with architects who will work into and make a feature of their houses such changes as are desired.

Then comes the paint. And next to real conveniences nothing is more essential to attractiveness and to service than real paint. The painters have used the slogan, "Save the surface and



A Complete Little Cottage

Modern home for small ranch or for housing ranch help. Ready cut or portable houses are inexpensive and save both time and material.

you save all." And surely in the matter of appearances many a dilapidated looking structure has been made a thing of beauty by a bit of color applied in the form of paint. And above all is the roof worth preservation. It costs money to re-roof a house. And with the painting for preservation don't forget the paint which is necessary for appearance and sanitation on the inside. There are enamels, varnishes and paints for every purpose, and let us be sure the kitchen has its quota.

As is noted about the plumbing, if electric lighting fixtures, vacuum cleaners, electric washers, irons and all other electrical labor savers may not be installed at once, the out of sight wiring may at least be done and these added later.

But further details are hardly necessary. The idea in making this little talk on home matters between ourselves is not to give plans and specifications or work out all the details of more conveniences and "more necessities," but is simply to inspire to thinking and demanding of ourselves more which leads to greater comfort and happiness on the farm.

To secure these details we believe we are entirely justified in referring our readers to the scrap book on the cover page. It is somewhat of a puzble, but will offer many a suggestion which will be found more completely given in advertisements appearing in former issues and which will appear in issues to come. Also let us not lose sight of the fact that "home" is not simply within the four walls of the house. The shrubs, the flowers, the bluegrass, the clump of trees behind the house, the equipment in barns and buildings, all unite in making the comfort of a home. And for all these needs there are suggestions in those scraps of advertising. Besides the music box, the piano, the camera, the telephone, house furnishings, electric appliances and other things essential for the inside of the home, there are suggestions for fruit trees for the home orchard, tanks and plumbing equipment, concrete paints, oils and greases for the tractor, hullers for almonds and walnuts, spraying equipment, farm engines, cream separators, poultry feeds and remedies, milking machines, pumps, tractors and implements, autos and motorcycles, and after all the rest are enumerated a sip of chocolate and a slice of raisin bread.

Let us make it a real farm home as well as a farm house. Let the boys and the girls learn that their home offers even more than the average town home in opportunities and in real enjoyment. When that is done the slogan, "Stay on the farm," will be unnecessary.

KILLING TREES

The most effective method of killing trees has been proved, according to the New Zealand Journal of Agriculture, to be a combination of ring barking and arsenical poisoning. This method consists in making a series of downward cuts with an axe, completely girdling the tree as near the ground as possible. None of the chipped wood is to be removed. The object is to make a kind of basin to hold the liquid. Poisoning should be done while the sap is down, the best time to treat willows being when the leaves are falling. To make the arsenical liquid, boil 3 pounds washing soda and 1 pound white arsenic in 1 gallon water; keep stirring till dissolved. Take from the fire and add 3 gallons cold water. A quart of this mixture is sufficient for a fairly large tree. If preferred 2 pounds caustic soda may be used in place of 3 pounds washing soda. In this case boiling is not required, as the heat generated by the caustic soda is sufficient to dissolve the arsenic. This liquid is very poisonous, and, as it is practically impossible to cleanse the vessel in which it is boiled, great care should be exercised in its future use; water from it would poison any animal. Instead of this mixture any of the proved weed killing specifics may be used. A strength at least double that advised for killing weeds would be necessary. This would save the trouble of making a special solution.

Agricultural News Notes of the Pacific Coast

Northern California

Colusa has hopes of securing a cannery for next season.

G. M. Homans, for many years state forester, died last week.

Shasta County is planning the building of three fine highway bridges.

A farm bureau center has been organized at Graton, Sonoma County.

A thousand new members are to be added to the San Joaquin County farm bureau.

The almond growers are still valiantly fighting for protection on the 5-15 basis.

The state university offers a short course in gas tractors at the Davis farm school January 2-7.

The Bodega-Valley Ford farm center is planning for a dairy cattle show soon after the new year.

Stockton potato growers report at least 2,500 acres of potatoes not to be dug because of low prices.

San Joaquin County planted 4,865 acres of vines during the past year. Of this 2,888 were Tokays.

A rumpus in the Glenn-Colusa irrigation district is resulting in agitation for recall election of the directors.

New directors have been appointed for the San Joaquin Fair and plans are starting for a fair to be held in the early fall.

Sonoma farm bureau has been conducting a series of pruning demonstrations under direction of Prof. Whitten.

Placer County farmers are discussing matter of farmers' mutual fire insurance under direction of J. A. Teagarden.

The Petaluma Cooperative Creamery manufactured 71,000 pounds of butter in September, 1921, as against 42,000 pounds in 1920.

Sonoma and Marin Counties are highly pleased at the winnings of the Pacific Slope Dairy Products Show held recently at Stockton.

Four long pruning demonstrations were given in Placer County last week under arrangements made at the Placer fruit growers convention.

The Rice Growers Association is keeping growers posted on conditions of the market so that they will not be induced to sell at lower prices than market justifies.

Farm Adviser Leonard of Sacramento County is preaching the gospel that the strength of the farm bureau movement lies in maintaining policy of non-partisan, non-sectional interest.

Last week at Stockton five conventions were held, all connected with dairy interests; ice cream manufacturers, milk dealers, California Dairy Council, creamery operators and California Butter, Cheese and Ice Cream Makers.

The annual convention of the California Cattlemen's Association was held last Saturday at the Palace Hotel, San Francisco. Representatives were present as well from the state department of agriculture and the forest service.

Residents of Tehama County are moving to reduce the number of grade crossings on railways. This movement has been started by the terrible accident in which a train struck a bus load of high school pupils, killing instantly ten. Four others have died since and only one of the load is still living.

Central California

Annual fig growers' convention and institute at Fresno, January 13-17.

The Fresno County farm bureau is forming a cow testing association.

San Joaquin Valley's Citrus Fair at Visalia last week brought out a big attendance.

Eighty-five applicants for citizenship are to be examined at Fresno on December 29.

Creameries at Hanford, Lemoore and Riverdale paid for November deliveries $370,000.

The Tulare Cooperative Poultry Association last month shipped $6,400 worth of poultry.

The citrus fair at Visalia last week brought out a large attendance from all valley sections.

The Waterford-Hickman farm bureau will give its annual dance at Hickman, January 7.

The Reedley, Fresno, chamber of commerce is arranging for a community Christmas tree celebration.

It is estimated that about 70 cars of fruit daily are leaving Porterville over the Santa Fe and Southern Pacific.

Proposal to transfer ownership of the fair site and buildings at Tulare to the county has been turned down.

Three days of pruning demonstrations were given in Stanislaus County last week under auspices of the farm bureau.

The federal census shows that out of Fresno County's 8,917 farms, 7,792 are irrigated. The farm acreage is 1,319,531.

Tulare County orange growers say no harm was done the fruit by recent cold weather; it but served to hasten coloring.

Because of the slow olive market growers of Yuba County are considering establishing a community cooperative pickling plant.

The sixth annual fig institute will be held at Fresno, January 13 and 14. Many entries have already been received for the dried fig contest in connection with the event.

Experts in long pruning from the university farm at Davis will give demonstrations in Santa Cruz County during the Christmas holidays, under auspices of the farm bureau.

Railroads compute carload shipments of grapes from California this season at 28,800, distributed in 6,200 cities and towns. The total value is estimated at over $50,000,000.

The Sun-Maid Growers is pushing its raisin sales in Europe and the Orient. It is planned to open offices in London and in one of the larger cities of China soon after the first of the year.

Prof. Bioletti of the state university gave four days to demonstration of vine pruning in Fresno County last week. Tree pruning demonstrations were given later in the week by G. L. Phillips of the pomological department.

The San Benito County farm bureau, although one of the youngest in California, has already done some excellent project work. The Farmers Mutual Fire Insurance Company of San Benito County has been a direct outgrowth of farm bureau work. The cow testing association is coming to a point where it is self supporting. Mr. Screaton is the official tester.

Southern California

The demand for lima beans is increasing; last week it went from $5.60 to $5.80.

The Yucaipa News reports an increasing number of orchardists using subsoilers.

Cotton gins of the Palo Verde Valley of Riverside County are running to fullest capacity.

Many citrus growers from other counties attended the Orange County citrus institute at Santa Ana last week.

Tests of various fertilizers will be made in Los Angeles County orchards the coming year under direction of the farm bureau.

The California Walnut Growers Association has distributed among its members $2,000,000 as final payment on this year's crop.

Orange County supervisors have called for bids on paved highway connecting the county park with the county highway system.

H. M. Armitage of the Whittier insectary is making plans to liberate colonies of parasitic enemies of red scale in citrus orchards of Orange County.

The Associated Chambers of Commerce of Riverside County is planning a big "Dairy Day" program when all phases of the dairy business will be featured.

President O'Neill of the Imperial Valley Vegetable and Melon Growers Association says outlook for the lettuce crop is very promising and in general the pea crop shows very good stands.

The chamber of commerce of Calipatria, Imperial County, is asking that the sheriff appoint deputies to be stationed at Niland to intercept the crowd of tramps and shady characters who are coming into the valley.

Apple growers of the Yucaipa Valley of San Bernardino County are getting together in an effort to secure one selling agency for their fruit, such as the California Fruit Growers Exchange or the Mutual Orange Distributors.

The report of the reconnaissance soil survey of the central southern area of California made by the bureau of soils, United States department of agriculture, in cooperation with the state of California, has been published and is now available.

Exposition Park Corporation has purchased 80 acres at San Luis Obispo and will put it in shape this winter to hold the county fair next fall. It will have an auto race track one mile long, barns and sheds for stock, a landing field for airplanes and a baseball diamond.

Tractor schools are announced by the farm agents of Los Angeles at Covina high school, January 16-23; Orange County at Santa Ana high school, January 30-February 4; Imperial County at El Centro, February 13-18; San Bernardino and Riverside Counties, time and place to be determined.

Another road meeting of the chamber of commerce of northern San Diego County was held at Ramona, December 2. It was decided to ask the completion of the road from San Diego through the northern mountains of the county, making a loop from Lakeside through Ramona, Julian and Descanso back to Lakeside.

The Coast and General

Oranges from the Yuma Valley of Arizona are showing beautiful color.

Regular shipments of lettuce are being made from Glendale, Arizona.

Florida expects to have over 7,000 acres planted to cabbage for the 1922 season.

Nearly 20,000 carloads of apples have been shipped already from Washington.

Arizona has more than 5,000 registered Herefords, nearly 3,000 bulls in service.

Light frosts in the Salt River Valley of Arizona have slowed up growth of alfalfa.

About 20 per cent of the fall grain had to be resown in Klickitat County, Washington.

Snow in Northern Arizona and New Mexico has put ranges in good condition. Some were in serious need.

Apple shipping records at Wenatchee, Washington, were broken recently when 300 carloads were shipped out in 24 hours.

It is reported that 75 per cent of the potato crop of Coconino County, Arizona, is being stored by growers in the hope of getting $3.

The national convention of the Farmers' Union at Topeka, Kansas, re-elected as president Chas. S. Barrett of Union City, Georgia.

Yakima Valley, Washington, sheepmen have marketed about 200,000 mutton sheep this year at an average of about $5 each net to the producers.

Olives left on the trees in Arizona were nipped by recent frosts and are being used exclusively for oil; the pickling season is practically over.

The Washington experiment station at Pullman will give a one week course in berry growing January 16-21; another in tree growing, January 23-28.

The government census report indicates the number of pure bred hogs in the United States as 2,049,900. Of this number 1,545,620, or over 75 per cent, are Poland China and Duroc-Jersey.

Governor Alcott of Oregon has called special session of the legislature to consider a special election on tax levy for the proposed world's fair at Portland in 1925. The special session convenes December 19.

The annual six weeks' farmers' winter school will open at the Western Washington experiment station at Pullman, January 2, 1922. Six weeks' course in poultry management and in dairy and livestock farming are offered.

According to figures announced by the federal bureau of markets at Spokane, Washington, Oregon, Montana and Idaho shipped a total of 43,215 cars of fruit, produce and vegetables during the six months ending October 31. It is estimated that the four states will ship a total of 75,000 cars of orchard and garden products before the present season is over.

During the week ending today six agricultural conventions were held at Spokane, Washington, including those of the Washington and North Idaho wheat growers associations, Washington State Horticultural Association, Northwest grade and pack conference, Washington and North Idaho Farmers Union, Northwest potato conference, and State Non-partisan League.

Calimyrna vs. Kadota

By Ira J. Condit

THE pendulum of progress in the California fig industry has been swinging back and forth from one variety to another for many years. We hope it will keep swinging until it is able to stop at a more decisive point than is possible at the present time; for the discussion regarding fig varieties is still being waged by intending planters. The former topic of "Calimyrna vs. Adriatic" has now in many sections given way to "Calimyrna vs. Kadota," or "Kadota vs. Mission."

The chief advantage of the Smyrna fig from a commercial standpoint is due to the excellent quality of the dried fruit. No other fig growing country has been able to produce dried figs of other varieties which approximate the Smyrna in flavor and quality. Figs of Italy, Spain and Portugal are all inferior and are exported to other countries mainly for cooking purposes. Since the trade and the consuming public have recognized this superior quality dried Smyrna figs have always been in greater demand and are quoted at higher prices than white figs of other varieties. The reputation of the dried Smyrna fig is based on quality and the California fig growers must learn to produce a dried Calimyrna second in quality to none, or else accept lower prices in the fig markets of the world.

The fresh Calimyrna fig at the proper stage of consumption has no superior among other fig varieties. Its golden yellow color, thin skin, amber pulp and rich flavor make it unexcelled as a fresh fruit. When picked in the proper stage the fruit can be marketed fresh not only on the Coast but by modern methods of packing and refrigeration, in distant markets as well.

Calimyrna fig trees grow as rapidly and bear as early as those of other varieties except possibly the Kadota. A few figs are frequently produced the third season but the trees cannot be expected to produce profitable crops until the sixth or seventh year in the orchard. The trees do not bear a first crop since the few figs which appear on the old wood cannot be caprified commercially by any of the varieties of caprifigs so far developed. Some of these first crop or breba Calimyrnas set and mature without caprification but they are seldom abundant enough to be of commercial value.

Experiences of growers in various parts of the San Joaquin Valley have shown that the Calimyrna tree will bear as heavily as the Adriatic at the same age if the former is properly caprified, by which I mean sufficiently to cause all or nearly all of the fruit to set and mature. Caprification is a detail in fig culture which must be attended to at the proper time and in the proper manner to get best results. Growers must secure the best varieties of caprifigs and provide against loss of crops by frost in order to reduce the cost of production and insure profitable crops.

The Kadota fig has been most commonly planted in Tulare and Fresno Counties where orchards from one to ten years old are common. The small immature fruit seems to be susceptible to heat damage in June and July, from 10 to 40 per cent of the crop being damaged or ruined in some seasons. For this reason the most extensive plantings of Kadota figs are being made in Merced, Stanislaus and San Joaquin Counties and in portions of the Sacramento Valley where the temperature is more uniform and the humidity higher.

The Kadota tree is a rank grower when given an abundance of water. Continued frequent irrigations are practiced in order to encourage a vigorous growth of the tree and a heavy production of fresh fruit. The figs are resistant to splitting and souring, faults which are so common with some other varieties.

The trees, like those of the Mission, Brown Turkey and most other varieties, bear two distinct crops of fruit. The first crop is produced on old wood, mainly of the previous season, and the fruit matures in June in the warmer parts of the interior valleys. In the southern coast districts the cooler weather causes the fruit to mature much later. The figs of the first crop are of large size, pear shaped, smooth skinned, green in color and somewhat glossy. The pulp is of a light strawberry color tinted with violet, is juicy, sweet and excellent in flavor. It is valuable for fresh fruit markets and for jam making but is mostly too large and perishable for preserving or canning.

The second crop is produced mostly on wood of the present season, the fruit beginning to mature in July and continuing to ripen as long as new figs appear in the axils of leaves and the weather remains favorable for their development. As with many other varieties, immature figs often hang on the tree throughout the winter and if injured by cold, ripen in early spring. The fruit of the second crop is of medium size, globular in shape, becoming smaller as the season advances; it is of a light lemon yellow color and sweet but lacks character and flavor. When eaten for comparison with either the Mission or the Calimyrna, the fresh Kadota is disappointing to most palates. Some people prefer it, however, on account of the absence of seeds and the lack of the peculiar flavor common to most figs.

The Kadota fig of the second crop has a tough skin underneath which is a white meat or rind of rubbery consistency to which the good qualities of the fruit are largely due. This rind and tough skin preserves the fresh fruit from bruises, prevents rapid decay or deterioration, holds its color well when cooked and is the prime factor in making the Kadota a leading fig for preserving purposes. This thick rind, however, is responsible for making an inferior leathery product when dried. Ordinary dried Kadotas are, therefore, not to be considered as much of a factor in making a Kadota fig orchard profitable.

The rapidity of growth and early development of the tree, its heavy bearing qualities and resistance of its fruit to unfavorable climatic conditions have placed the Kadota among the four leading fig varieties of California. The fruit can be readily marketed fresh both to local and distant markets. It can be preserved or canned or made into jam, such products finding wide favor and good demand. The dried Kadota, while tough and inferior, is a clean and sweet product; with more careful methods of processing it can be marketed to advantage.

Experience during the past season has demonstrated that fresh figs can be picked and packed in California, precooled, and delivered in Chicago or New York in good condition for market. The Calimyrna fig is especially adapted to this fresh fruit trade on account of the large size, fine quality and attractive color of the fruit. The Kadota will carry still better on account of its firm texture, but the comparatively smaller size of the fruit will mean lower prices for it in competition with the Calimyrna.

Many tons of Calimyrna figs as well as Kadotas were sold to canning and preserving plants this season. The main objection to the Calimyrna for canning under present conditions is the large size of the fruit. It is possible that in future a premium will be paid for large, fancy figs, as for peaches, but this is not true now.

The canned fig put up in a light syrup will provide an outlet for a large tonnage of fruit whereas the preserved fig put up in a heavy syrup will be more of a delicacy. The uncaprified Kadota is not regarded as of very much value for drying. The caprified Kadota, however, is of excellent quality dried and is resistant both to splitting and souring.

On account of its large first crop of fresh figs and the second crop of figs which can be harvested fresh for preserving or caprified and allowed to dry, the Kadota seems to be the nearest approach to an all purpose fig which so far has been grown commercially.

Development of the Lower Colorado

By E. C. LaRue, Hydraulic Engineer, U. S. Geological Survey

THE Colorado River with its drainage basin comprising 244,000 square miles affects the states of Wyoming, Utah, Colorado, Arizona, Nevada, California, New Mexico and the Republic of Mexico.

Last year I said that the Colorado River was formed by the junction of Green and Grand rivers in southeastern Utah. This statement is no longer correct. The congress has changed the name Grand to Colorado. Therefore we should say that the Colorado River has its source on the western slope of the continental divide in the state of Colorado. It flows in a southwesterly direction, passing into Utah, where it receives an important tributary, Green River. The area of the Colorado River basin above the Green is 26,000 square miles, while that of Green River is 44,000 square miles. In volume of flow the Grand, now Colorado River, is the larger stream, having an average annual runoff of about 7,000,000 acre feet, as compared with 6,000,000 acre feet from Green River. Is it not possible that some map makers may call the Grand and Green rivers the east and west forks of the Colorado and thus divide the honor between the states of Wyoming, Utah and Colorado?

Survey of Canyon

In 1914 I made a boat trip to the junction of Green and Grand rivers, followed by another trip in 1915 through 150 miles of the canyons of the Colorado to Lee Ferry, Arizona. About six weeks ago I completed a third trip through 350 miles of the canyons of the Green and Colorado rivers. This region is almost inaccessible except by boat. I had an opportunity to observe any changes that might have taken place in the canyon since 1915. It is true the name Grand River has been changed to Colorado River, but I can positively swear that our pathway was not obstructed by dams completed or dams under construction. The proposed dam sites offered no obstruction to the boats except at one site where bedrock appears at the surface in the river channel. So it is apparent that the great engineering problems of the Colorado River are not yet solved. Complete development of this great river basin will place under irrigation nearly 6,000,000 acres of land, 2,000,000 acres of which are now irrigated. Less than 100,000 horsepower is now developed in the basin, but at some future time this may be increased to more than 5,000,000 horsepower.

Irrigation Features

Many important undeveloped irrigation, storage and water power projects are located in the upper basin in Wyoming, Utah and Colorado. The development of these projects will have an important bearing on the plans of development of the lower river, but the magnitude of the projects on the lower river would not be seriously affected. For 700 miles the Green and Colorado rivers flow through canyons in a region where irrigation development is not possible.

At present more than 500,000 acres of land below Boulder Canyon are being irrigated with the waters of the Colorado. With ultimate irrigation development this area may be increased to more than 2,000,000 acres. Along the lower river the demand for water for irrigation is increasing each year, and if a shortage is to be prevented the low water flow must be increased by means of storage. The Colorado annually discharges into the Gulf of California more than 13,000,000 acre feet of water, which is not only a waste but a serious menace to irrigation interests on the lower river during the annual spring floods. The estimated value of the irrigation development and allied industries below Boulder Canyon is approximately $100,000,000. This property needs protection from the ravaging floods, and the low water flow of the river should be increased to make possible the irrigation of an additional area of more than 1,000,000 acres of barren desert land. It is thus apparent that the matter which is most urgent is the building of storage works to provide protection from floods and the regulation of the flow to conform to the demand for water for irrigation. Fortunately the storage works may serve a third purpose in making possible the development of a large amount of hydroelectric power.

Water Power Development

During recent years there has been a rapid growth in the water power market in the southwestern part of the

Select Fruit Trees

Direct to You from Our Nurseries

This finely illustrated catalog just completed

—contains a full description of all the desirable varieties of Citrus, Tropical and Deciduous Fruit Trees and Vines, Ornamentals and the world's best Roses, telling how to plant and grow them.

For over thirty years we have been supplying nursery stock to small gardens as well as the large commercial growers throughout the Southwest—direct from our nursery to your garden or orchard.

Take advantage of our complete stock from which to make your selection. We are selling trees that we grow ourselves right on our own 370-acre propagating grounds. You get them fresh from the soil.

Your appreciation of the California Cultivator can be shown best by writing to and buying from Cultivator advertisers.

United States. For example, in California alone the available power from hydroelectric and steam plants is about 1,000,000 horsepower. Applications filed with the federal power commission affecting the state of California call for the development of more than 3,800,000 horsepower. It has been estimated that the utilization of these undeveloped power sites will take care of the demands of the state of California until about 1935. There is at present a demand for cheap power in the mining districts of Nevada, Arizona, Utah, New Mexico and southwestern Colorado. In northern Arizona and southern Utah there are many mining projects which cannot be operated successfully until cheap power is made available.

Flood Control

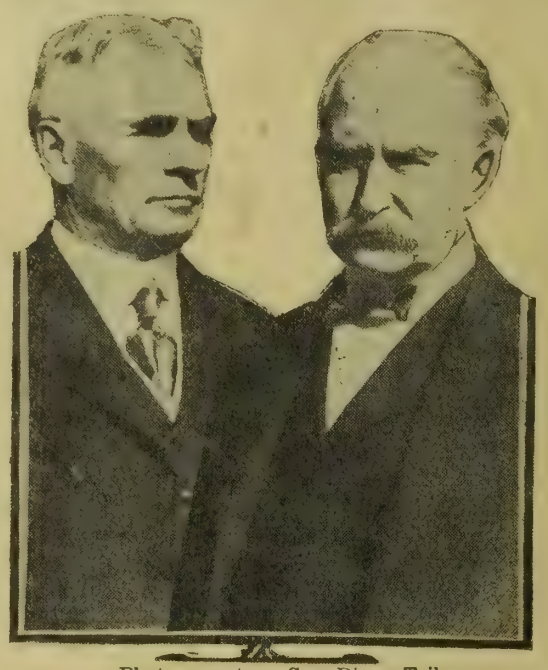
While the matter of flood control and the regulation of the flow to conform to the demand for water for irrigation is most urgent there is also a demand for power. These three important phases of the project should be given serious consideration by those who are entrusted with the responsibility of determining the most feasible plan of development for the lower river. A study should be made of the whole Colorado River basin. Any contemplated development on the lower river should fit in as a part of a comprehensive plan for the development of the water resources of the Colorado basin from Wyoming to the Gulf of California. Such a plan, at least in tentative form, should be available before a decision is reached regarding the development of large storage projects on the Colorado below the mouth of the Green River.

Attention has been called to the amount of water annually wasted into the Gulf of California. I will suggest a plan which if carried out would make possible practically full utilization of the waters of the Colorado from the mouth of Green River to the gulf. Making due allowance for complete development in the upper basin, some such plan as the one given below must be carried out if the enormous waste of water in the lower Colorado is to be prevented.

One of Plans

1. It is suggested that a dam may be built on the Colorado River immediately below the mouth of Green River to raise the water 170 feet, or to an elevation of 4,050 feet above sea level. The storage capacity of such a reservoir would be 3,000,000 acre-feet. If this project were developed in this manner it would not interfere with the proposed irrigation development at Green River, Utah. The town of Moab, Utah, would be submerged, but it would not be difficult to relocate this town at a higher and better site on Mill Creek. This is primarily a power project. However, its development would have an important effect on the flood flow of the lower Colorado. The water power capacity of the project would be about 110,000 horsepower.

2. We may now drop down the Colorado 210 miles. There are a number of dam sites on this section of the river which should receive careful study. The final analysis of the projects in this region, however, may show that the most economical development may be had by building a high storage dam on the Colorado at Lee Ferry. If this plan were followed 210 miles of the Colorado and about 90 miles of the San Juan River would be utilized as a storage reservoir. A topographic survey of this great reservoir site is now being completed by the United States geological survey. The results of these surveys are not yet available. Complete development of the Lee Ferry project calls for a dam to raise the water 700 feet, or to an elevation of 3,820 feet above sea level. The estimated capacity of the reservoir is 50,000,000 acre-feet. The power capacity of the project is 1,000,000 horsepower, with the flood flow of the river reduced to a maximum of 20,000 second feet. About 90 per cent of the flow of the Colorado at Yuma passes the Lee Ferry dam site. The Little Colorado and Virgin rivers join the Colorado below Lee Ferry. These tributaries are subject to occasional floods. There is a reservoir site at Tolchaco in the lower basin of the Little Colorado, where a dam to raise the water 50 feet would control the entire flood flow of this stream, making possible the regulation of the flow to 600 second feet or less.



Photo, courtesy San Diego Tribune.
For the Conservation of the Rio Colorado
At the reader's right, A. B. Fall, secretary of the interior, and recently in California investigating as to the needs of the Southwest. At the left Arthur P. Davis, chief of the reclamation service, department of the interior.

Marble Canyon

3. Between Lee Ferry and the west boundary of the Grand Canyon national park the Colorado falls about 1,300 feet. Surveys have not been made to determine the most feasible plan to develop power on this section of the river. It may be feasible to build a dam in Marble Canyon at a point about 15 miles above Little Colorado River to raise the water about 230 feet. By constructing a 32 mile tunnel this water could be carried to Tapeats Creek and dropped under a head of 950 feet. It would probably be necessary to allow the low water flow to pass through the Grand Canyon national park, leaving about 16,000 second feet available for power purposes. Under these conditions about 1,280,000 horsepower could be developed. The development of this project would be expensive. Many years may pass before it may be necessary to develop this section of the river, at which time the national park service might welcome the construction of dams within the park in order to make the Grand Canyon of the Colorado more accessible. It seems probable that the available water power of the Colorado between Lee Ferry and the west boundary of the Grand Canyon national park may be more economically developed by constructing a series of low dams. This is purely a power project and would have but little effect on the flood flow of the lower Colorado.

Private Parties

4. Private parties are now investigating the feasibility of building a power dam on the Colorado immediately above the mouth of Diamond

Creek. I understand that it is proposed to construct a dam to raise the water about 250 feet. However, maximum development of this site calls for the construction of a dam about 500 feet in height. It may be more economical to develop power on the Colorado between Diamond Creek and the west boundary of the Grand Canyon national park by constructing two dams, each dam to raise the water about 250 feet. The maximum power capacity of this project is about 830,000 horsepower, assuming that the flow of the river is regulated by storage above. Without storage the maximum capacity of the Diamond Creek power project would be about 200,000 horsepower.

5. The United States reclamation service has made investigations to determine the feasibility of building a high storage and power dam at a site in Boulder Canyon a short distance below the mouth of Virgin River. It may prove feasible to build a dam at this point to raise the water 550 feet, creating an available storage capacity of 26,500,000 acre-feet. The plan of development calls for the regulation of the flow to meet the demand for water for irrigation and the regulation of the flood flow to 50,000 second feet or less. About 600,000 horsepower may be developed at the dam. The cost of the storage dam is estimated at about $50,000,000. There are one or two dam sites on the Colorado between Boulder Canyon and Fort Mohave where it may be feasible at some future time to build dams for the purpose of regulating the flow for irrigation and provide for the development of possibly 150,000 horsepower.

Summary

Attention has been called to the urgent need for storage in order that the irrigation interests on the lower river may be afforded protection from floods and that the flow of the river may be regulated to conform to the demand for water for irrigation. The desired regulation of the flood flow for irrigation and flood protection may be had by building a high storage dam at either Boulder Canyon or Lee Ferry. The conditions at Boulder Canyon have been pretty thoroughly investigated. The engineering investigation of the Lee Ferry project has not been completed. The data now available indicate that the Lee Ferry project located above the Grand Canyon with its large storage capacity and favorable conditions at the dam site may be the key to the plan for complete development of the lower river. It would seem that a report on the flood control, irrigation and power problems of the lower Colorado would not be complete if it did not include an engineering report on this project.

It is my opinion that the federal government should at the earliest possible date prepare a report showing a comprehensive plan for the development of the water resources of the entire basin of the Colorado River. Each approved project would then be a unit of the major project. When such a comprehensive report is available and has been approved by the interested states and the Republic of Mexico, some real progress will have been made. Proceeding in this manner a large project on the lower river, being a unit of the major project, could be selected for immediate construction without fear of serious opposition.

INFERTILE PERSIMMONS

There has been an unusual number of complaints during the past season of dropping of Japanese persimmons when but partially grown. On many standard varieties there is a paucity of fertile blossoms, that is, they have pistillate blossoms largely in excess of the staminate or pollen bearing. If the pistillate blossoms (having only a pistil in center of flower and no staminate or pollen bearing organs surrounding pistil) are pollinated by hand a good crop will result. But this is impossible beyond the limit of one pet tree. The remedy in the orchard is to plant an occasional tree that produces an abundance of staminate blossoms over a long blooming period so that bees, wind and other agencies may fertilize the flowers. The best variety for this purpose is the Gailey. Some Japanese varieties are sufficiently self fertile, but even these vary with treatment and climate.

Home Pickling of Ripe and Green Olives

By W. V. Cruess

ON ACCOUNT of the general business depression the sale for ripe olives has been curtailed. For this reason fresh, unpickled ripe olives may now be purchased direct from the grower at very moderate prices. The pickling process is not difficult to follow and very excellent pickled ripe olives may be produced in any home without special equipment. The state university offers the following recipe:

Ripe Olives

Use firm ripe olives of the Mission or the Manzanillo varieties. Place these in a wooden bucket or a glass or stoneware jar or crock. Do not use metal.

Prepare a lye solution containing two ounces of lye to a gallon of water, or approximately one-half pound to five gallons of water. Use a good grade of lye, such as Red Seal or Babbitt's. Thoroughly dissolve the lye in the water before adding the solution to the olives.

Cover the olives with this solution. Stir the olives once an hour and allow the lye to remain on them until it has penetrated the skin of all the olives, but has not entered the flesh of the olives more than one-sixteenth of an inch. The fruit may be cut with a knife from time to time to note the progress of the action of the lye. The flesh will be discolored, that is, turned yellowish brown, by the action of the lye. It ordinarily requires about four hours for this action to proceed far enough.

Remove the lye solution but do not discard it. Expose the olives to the air in the vessel in which they have been treated, stir them three times a day and leave until jet black in color, usually about four days.

Return lye solution to the olives and allow it to stand until it reaches the pit of the olives. This will usually be about eighteen hours. If it is found that the lye does not reach the pits of the olives it should be drained off and to each gallon of the liquid one-half ounce of fresh lye should be added, or about one-fourth pound to five gallons.

When the lye has reached the pits of the olives remove it and discard it. Cover the olives with fresh water which should be changed three times a day until the olives are free from any taste of lye, usually a week.

Prepare a brine of one-quarter pound of salt to a gallon of water, allow the olives to stand in this about three days. They are then ready for use or for sterilizing.

Place the olives in jars or cans and add boiling hot to them the brine in which they have been standing. If cans are used seal them at once; if jars are used place on them the scalded caps and the best rubbers obtainable, such as the Cold Pack rubber or the Good Luck rubber—cheap rubbers cannot be used. Screw the caps on the jars loosely. Place the jars or cans in a pressure cooker and heat to ten pounds pressure for forty minutes. Turn out the fire and allow the retort to drop to zero pounds pressure. Remove the jars while still hot and seal at once.

If a pressure cooker is not available sterilize the olives in the jars or cans in a wash boiler for two hours at the boiling point and then seal them. In this latter case, however, it is necessary to boil the olives for twenty minutes after the jar or can is opened for serving. Olives sterilized in boiling water cannot be offered for sale.

Green Olives

Use olives that have reached full size but are still hard and green.

Prepare a lye solution of one and one-half ounces per gallon of water or approximately one pound of lye to ten gallons. Use granulated lye such as Red Seal or Babbitt's.

Place the olives in this solution and allow to stand until the lye reaches within a very short distance of the pit. Stir the olives frequently during this treatment.

Remove the lye solution and cover the olives with fresh water. Change the water daily until the taste of lye is removed and until most of the bitterness has been washed out of the olives. This will require about seven days.

Place the olives in a barrel or in ordinary fruit jars and cover with a brine consisting of half a pound of salt to a gallon of water. Fill the barrel or fruit jar full and seal.

Set aside until the proper flavor has developed, usually about five or six months.

Fermentation is improved if to the brine is added a small amount of good vinegar; about half a pint per gallon of brine.

SAN LUIS HAS FARM BUREAU

San Luis Obispo County has at last formed a county farm bureau, and the supervisors have appropriated the money necessary for a county agent who will probably start his duties the first of the year. The officers of the county farm bureau are: E. R. Lewis, Edna, president; Alex. McMillan, Shandon, vice president; A. R. Sprague, Atascadero, secretary-treasurer.

Farm centers are now organized at Edna, Cholame, Shandon, Los Plitas, Park Hill, Union, Arroyo Grande, Atascadero and Templeton. Other districts are being organized, using school districts as units.—Warren C. Day.

COMPARE THE PRICE OF

REMCO TANKS

With Prices of Metal Tanks of Same Capacity and You Will Find the Remco Redwood Tank Much Cheaper. It is also Better and More Lasting.

We will ship you, immediately on receipt of order, any standard Remco tank of the dimensions or capacities shown below at the prices here listed:

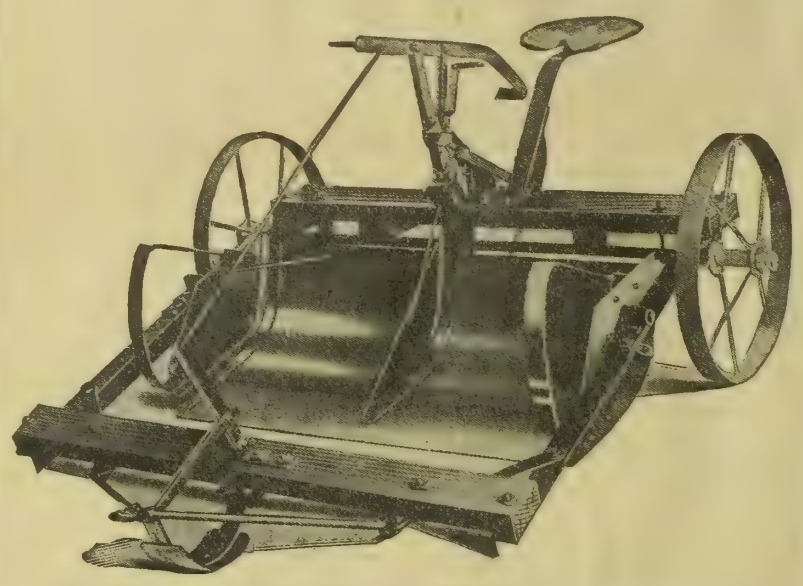
The Miskin Scraper

Is the Best Scraper on Earth

And We Can Prove It

Write for Circulars



The above is a cut of the Famous Miskin Scraper, which in operation, easy draft, greater capacity, and better work has many advantages over the common Fresno and wheel scrapers now on the market and is guaranteed to take twice the dirt per trip with the same horsepower.

Made in 2-horse, 3-horse and 4-horse sizes. Can be operated by small tractors from the tractor seat by the tractor driver.

Send for descriptive circulars, with lowered prices, or ask your dealer to send for one on approval. We pay the freight.

Miskin Scraper Works, Ucon, Idaho

TEAGUE QUALITY TREES

CITRUS and TROPICAL

Make productive and profitable orchards. Our many satisfied customers will tell you that it pays to buy **Teague Trees.**

The supply of good citrus trees for 1922 is somewhat limited, so place your order early and get the best.

Our field grown avocados are the best that can be produced. We have all of the recommended varieties. Ask for our latest price list. **It's free.**

Our new book on Citrus and Tropical Fruit culture fully describes varieties and gives cultural directions for the planting and care of the orchard. Price 50c.

Vineyard Fertilizing

By Fred K. Howard

WITH the prospect of lower prices for all varieties of grapes in the near future, vineyardists are giving more attention to the problem of fertilization at the present time than has ever been given this very important matter in the past.

Intelligent fertilization programs will undoubtedly be planned and applied to large acreages in the vineyard districts, beginning with this season. Attention to this work is not coming too soon since growers have consistently taken off large crops of fruit annually and have, except in rare cases, put little or no plant food back into the soil.

Continued irrigation, particularly in the lighter soils, has had much to do with the rapidly decreasing humus content of soils in irrigated districts, and growers are now finding that they must use larger quantities of irrigation water to properly mature their grapes than ever before. This condition is due largely to deficient humus or organic matter, and the only remedy which can be relied upon to correct the trouble is, not more water, but organic fertilizers. With incorporation in the soil of such fertilizers the vineyardists may expect a corresponding decrease in the amount of water required and a very marked improvement in the quality and quantity of their product.

Another factor which has had much to do with the decreasing organic content is the continued turning over and too much deep cultivation of the lighter soils during the hot weather. Many soils due to this mistaken cultural practice are now in such shape that the application of irrigation water does little more than wet the soil to a depth of a few feet, which rapidly leaches away or evaporates. Consequently the vines get very little value from the soil moisture in the way of soluble plant foods because that water is not held long enough around the soil particles to get much of the available plant food in solution.

Undoubtedly the answer to this problem is the application of organic manures of some kind. Chief among these is perhaps stable manure, but with the rapidly increasing demands for this material in the vineyard sections the supply will probably not be sufficient to meet the needs, therefore every effort should be made by dairies producing this material to conserve it in such a manner that it retains its full fertilizing value. Dairy and stock men should therefore seriously consider maintaining compost piles and realize that part of their income can be acquired through the sale of manure.

Cover crops or, properly, green manure crops, are a source of organic manure which is becoming more and more popular each year. The problem of growing cover crops, however, in the vineyard districts is one which requires considerable thought and attention to detail, since in many of the older vineyards the leveling was not properly done before planting and it is difficult or sometimes impossible to irrigate in such a way that any quantity of the seed of these cover crops will germinate. Where irrigation is impossible the grower must depend on the rainfall and this, unfortunately, is an uncertain quantity. Green manure crops have been found to be very difficult to start in soils which are extremely deficient in organic matter. Very often attempts to secure such crops are complete failures the first season, but if persisted in, the second season satisfactory results are usually obtained. In this connection it is interesting to know that planting of some winter growing cereal along with the legume seed often gets results which are satisfactory from every standpoint. One of the best cereals to use for this purpose is rye. While this plant is not a nitrogen gatherer it does furnish large quantities of organic material and thus improves the physical condition of the soil so markedly that better results may be obtained with legumes. Commercial fertilizers may be used in vineyards to good advantage, particularly when the grower is attempting to start a green manure crop. These materials are usually in quite quickly available form, and in worn out soils a liberal application may mean the difference between success and failure in producing a profitable tonnage of green manure and also help to produce quantity and quality grapes during the succeeding year. In fact, anything that offers reasonable returns on the investment in the way of fertilizers should not be overlooked at this time by the vineyardist. His only question should be whether or not he is getting these materials at the best possible price.

Seedling Avocados

By Ernest Braunton

IT IS folly for one expecting to grow avocados for market to plant seedlings, no matter what the seeds are, even though taken from the best named varieties. Experimenters having plenty of soil area are planting the best of these varieties but are labeling all trees to see what results are obtained, how much like the parent the resultant fruits are, etc.

William Hertrich now has a bearing tree from a select fruit of the Murrietta, an excellent named variety. The fruit on the seedling is a small Mexican thin-skin. W. A. Spinks has this year fruited the first seedling from the Spinks, a tree of unusual vigor and of large size for its age. The fruit is a rather small thin skinned Mexican, nearly globose in shape. About 99 out of every 100 choice seeds planted bring but disappointment.

But the size and quality of the fruit is only a small part of the troubles that beset the planter of seedlings. A recent visit to the largest seedling orchard known in California revealed the fact that but 29 out of 100 have fruited at 12 years of age. Some may never fruit, a few more may each year, even to a quarter century old. Such lack of crop would prove a death blow to any fruit industry. In addition to this, not one of the trees has produced fruit as good as any of the best 25 varieties now in the market, and all are greatly inferior to the official list of five.

This seedling orchard contains trees of every possible form, from lofty, slender columns to low, spreading shrubs. The foliage also varies much in form and size and somewhat in color. The fruits are still more variable and nearly all poor in appearance and quality. Some are long, slender, crooked in form much like small "crookneck" squashes, others pear shaped, oval or round. On the whole results are a great disappointment to the planter. The seeds were saved from the tables of a leading Los Angeles hotel and were from many sources, including the best California grown varieties. The intending planter had best stick to the preferred list. Some who know claim the Dorothea superior to the Pueblo and there are several good varieties not in the list that are proving sufficiently promising to warrant planting. The variety committee of the avocado association is watching these closely and will no doubt each year report on a few of the best.

In the opinion of all best qualified to judge, when varieties better than those we have are found they will come from the seedling orchards now growing from seeds of the best varieties we have or from seeds of fine types sent here from Guatemala. Not much is now expected from budwood imported, for of the last 20 named varieties sent from the Central American field by government explorers not one that has fruited locally proves better than the five named varieties most popular with planters.

Legal Queries

Pipe Line

Eight years ago the owner of land granted to me a right of way for a pipe line. The land has since been taken over by a mortgagee. Can the right of way be revoked by the new owner? If the earth above the line becomes shallow through cultivation so that tools injure the pipe, who is responsible for mending it? Must I bear the cost of taking the pipe up and relaying it? Would the fact that I have given the right to a side pipe line to the grantor's own property in any way change my rights?—Subscriber, Orange.

If the right of way was given by a grant prior to the date of the mortgage and that grant was recorded prior to the date of the mortgage, it would take precedence over the mortgage; that is to say, the owner of the land could not give a valid mortgage which would in any way convey this right of way any more than he could give a mortgage for any other land which he had already conveyed, nor can subsequent transactions in respect to the grantor's land whether by mortgage, deed, or otherwise in any wise affect the right of way given. But if the grant was made subsequent to the mortgage or recorded subsequent to the mortgage, then the mortgagee would in no wise be bound thereby and would be entitled to require you to take up your pipe line. In cases where a right of way for a pipe line has been given, the owner of the pipe line is entitled to have this right of way observed by the owner of the adjacent land and in case of any injury thereto, the land owner would be required to repair such injury, if it occurred particularly in the manner mentioned in the question. The pipe line owner is entitled to have his pipe line remain in exactly the position in which it was placed and he has the right of ingress and egress thereto in order to make incidental repairs, which repairs, of course, would be at his own cost. He is not entitled to change the way, so that it will be different from that which was granted.

Collecting

A resident of adjoining state has sold personal property to a party located here, upon an installment contract. The owner of this property owes me and I desire to know if there is any method of collecting the moneys arising from this installment contract.—Subscriber, Coachella.

An action may be commenced in your township or county court, as the amount of the demand requires, and attachment or garnishment levied upon the property owned or person purchasing it. Publication of summons may then be made on the defendant residing in an adjoining state and if he fails to appear, default may be entered and his interest in the personal property and the amounts accruing thereon acquired and the execution issued upon this judgment. It is necessary in this class of cases that an attachment be made.

Make a Will

I have two daughters and a son. How can I leave nearly all of my property to my son?—Subscriber, Van Nuys.

This may be done by will properly executed.

Bankruptcy Proceedings

How does one proceed to take bankruptcy? We own nothing but household goods. — Subscriber, Carpinteria.

A petition is filed setting forth the fact that a person is insolvent and desires to be declared bankrupt, to which is annexed a schedule of debts owed and assets which the party may have. This is filed in the federal district court. As the form of such petition and schedules is very particularly set forth in the federal bankruptcy act it would be probably necessary for you to consult an attorney. Your household goods and also wages would be exempt from the payment of the debts.

Probate Estate

My mother recently died in Kansas, leaving real property in her name. There are no debts or other heirs. Another farm had been sold upon contract, in which contract my father, who is still living, has an interest. What steps are necessary to take to convey this interest and settle the estate?—Subscriber, Bakersfield.

It would be necessary to have the estate probated and the court declare that there are no debts or heirs other than yourself. In such probate the court would authorize the administrator to collect the moneys due upon the farm sold under contract and give a deed therefor.

Tax Title

Have been paying taxes on abandoned lands. How long is it necessary to pay such taxes before securing title? How does one get such title?—Subscriber, Kingsbury.

It is necessary to do a great deal more than pay taxes on lands in order to obtain title. The only right for such purposes is to found a claim for adverse possession. As no claim is here made under written instrument it is necessary for the party desiring to obtain such lands to protect them by substantial enclosure and to cultivate or improve them in the usual manner for a period of at least five years, and during all of such period he must continuously pay all taxes, state, county, or municipal, which are levied or assessed upon such land. After that period an action may be commenced in the superior court of the county wherein the land is located, joining as defendants all parties who may appear to have ever had any interest in this land, setting forth the facts constituting the facts of adverse possession, and this action must then be prosecuted to a judgment. The judgment is then the title on which the claimant under adverse possession must rely, if he can obtain it.

Pasture Land Unfenced

Four adjoining sections of mountain land are surrounded by one fence, but there is no cross fencing. One party owns 640 acres; another 950 acres. The owner of the section pastured some 400 head of cattle, who, wandering from their own land, have denuded the pasture of the other party's land and have thus prevented him from using any part of his land for pasture. Has he any claim for damage?—Subscriber, Visalia.

As the owner of the larger portions

KIRKMAN NURSERIES

Established in California in 1888

RELIABLE TREES AND VINES

are essential to the great fruit industries of the Pacific Coast.

Our experience has been gained by 32 years of progression in the nursery and orchard business in California.

We offer our services in undertaking the planting and care of commercial orchards on large scale.

Kirkman Nurseries, Inc.

Main Office:

Fresno, California

Member of Bud Selection Association of California

of land did not have his land under fence, it does not appear that he has any right as against the straying herds from the 640 acre owner. He might have had the right to take up these straying cattle and empound them if he had found them on his land, but as he did not do this and damage is done, it appears that he has no claim.

Soldiers' Homestead

I am an ex-soldier with 22 months of service and desire to take up a homestead. How long will I be required to stay on the homestead and how much improvements will I be required to make?—Subscriber, Cottonwood.

The time which the homestead settler has served in the army, navy, or marine corps shall be deducted from the time required to effect title. In case of any discharge on account of wounds received or disability incurred in the line of duty, then the time of enlistment shall be deducted from the time required to effect title without reference to the length of time he may have served. He must reside upon the land, improve and cultivate it for a period of at least one year after he shall have commenced his improvements. The usual period of residence upon homestead lands is five years from the date of entry. At the expiration of that time or within two years thereafter, the entryman must prove that he has resided on and cultivated the land for five years. It seems that there is no exemption from the cultivation requirements for ex-soldiers other than the lessening of the time.

Riparian Rights

What are riparian rights?—Subscriber, Herndon.

Several very large dry books have been written upon the rights of riparian owners of land. In short, a riparian owner is entitled to have the water in a stream come to him unpolluted in quality and undiminished in quantity and subject to the right of upper owners to such use as they are entitled to make of the water. A riparian owner is entitled to use water as it passes his land for domestic purposes and take out a reasonable portion for irrigation of his abutting land.

Distributing Irrigation Water

Our land has been in an irrigation district for a number of years and has had no water as the main laterals are three miles away. The directors say that it will be necessary for us to put in these laterals at our own expense, although they have put in other laterals at the cost of the districts. Can we compel the districts to bring water to our land?—Subscriber, Crows Landing.

A question involving as much as this does necessarily would require a much more careful investigation than it is possible to give in a medium of this character. An inspection of the act would seem to indicate that it in itself contains certain remedies. The irrigation act was made in order that a convenient method could be adopted for the irrigation of any given territory embraced therein. Section 18 of the act expressly provides that all waters distributed for irrigation purposes shall be apportioned ratably to each land owner upon the basis or ratio which the last assessment of said owner for district purposes within the district bears to the whole sum assessed upon the district. Under the powers of the directors it is stated that the board of directors may construct necessary works for the collection of water and do any and every lawful act necessary to be done that sufficient water may be supplied to each land owner in said district for irrigation and domestic purposes. At another point the act provides that in case the money raised from bonds is insufficient for the completion of the plan of the works it shall be the duty of the board of directors to provide for the completion of the plan by levy of assessments therefor. Then there is a provision that the boundaries of any irrigation district may be changed and tracts excluded therefrom by the filing of a petition with the board of directors of the district, stating the reason upon which it is claimed that the land shall be excluded. There is an elaborate provision for the procedure thereafter, which it is unnecessary to state. It would seem, therefore, that an action would lie to compel the irrigation trustees to carry out the duties which are imposed upon them; that is to say, providing for the distribution of water over the whole district.

Upkeep of Mortgaged Property

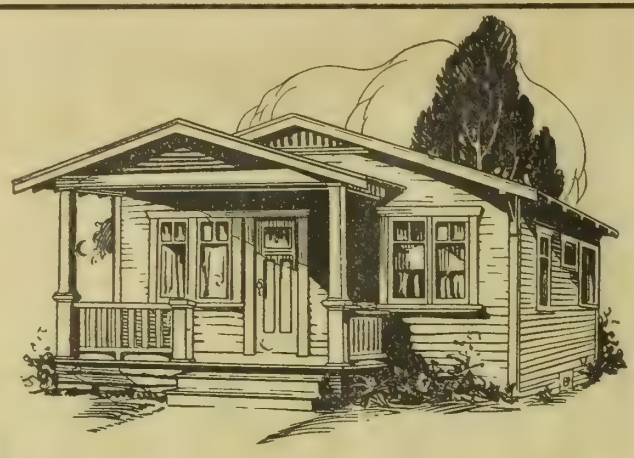
I hold a mortgage on a piece of property, the owner of which has left the country. In case I supply moneys for the upkeep of the livestock and trees upon the place, would I be able to recover this money on foreclosure of the mortgage?—Subscriber, Tecnor.

The usual mortgage provides that moneys expended for such purposes constitute a lien and may be recovered on foreclosure proceedings.

Verbal Contract

I am raising chickens for broilers. A party desired to select good pullets, stating that he would be willing to pay a little above the market price. He now desires to purchase them only at the market price. I refused to sell them. The amount of contract is something over $500 and is merely verbal. What are the rights of the parties?—Subscriber, San Gabriel.

An agreement for sale of goods, chattels or other personal property at a price not less than $200 is invalid unless the contract or some note or memorandum thereof is in writing and subscribed by the party to be charged or by his agent or unless the buyer accepts or receives part of the goods or chattels or the evidences or some of them, or other personal property, or pays at the time some part of the purchase money.



This Home Ready-Cut, Complete $597.25

—The attractive four-room home illustrated above, ready cut, complete, for $597.25 F. O. B. Los Angeles.
—You can see the house on display at our yards, 2045 East Vernon Ave., or you can get full information, see blueprints, etc., at 415 East Ninth St.
—Any one of these homes will save you money. Our improved methods effect many economies.
—This is only one of the many plans you can make your selection from. Any of them can be furnished, Sectional-Built, Ready-Cut or Ready-Cut for Plaster, just as you prefer.
—Write us fully about any home you are contemplating.
—Ask for special garage plans.

Questions and Answers

Questions to be answered in this department should be received at the office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Apple Seedlings

If I plant apple seeds in greenhouse now about how large will plants be by May? Where can I get Mammoth red raspberry plants?—Subscriber, Fresno.

The size of the apple seedlings will depend much on treatment, temperature, etc., but will grow only a few inches at best. Greenhouse conditions do not seem very favorable to apple trees, and so soon as weather is warm in spring would move them out into full sunlight, whitewashing the bare stems to prevent sunburn of tender bark. We do not know of a red raspberry by the name of Mammoth; the St. Regis is the largest red raspberry we have seen, though some selected Cuthberts bear equally large fruits.

Pruning Quince and Persimmon

Would like information regarding pruning of quince and persimmon trees. Does the long pruning system of pruning (Dr. Whitten's) apply or the old stub system?—Subscriber, San Diego.

The long pruning applies to all trees as it consists largely of thinning to allow light to enter and give all parts of the tree the same chance to bear fruit. It may therefore properly be called natural pruning or what the tree should itself do if left alone and even what some do when in an uncultivated or wild state. We would not "stub" or short prune either of the trees named. Prune both to leave outward and upward branches of drooping tendency.

Manure in Furrows

I am interested in article by A. D. Shamel in your issue of September 17, on application of stable manure in furrows. I want to try an experiment in my small orchard at home place to see how it works out, but there are some points that are not quite clear to me, and I would like to have some further light on the subject. Now you say to use five cubic feet of manure to the tree. I can not see how you can get five cubic feet of manure in a furrow only eight inches deep, and you do not say how wide the furrow should be, whether a foot, or 16 inches, or how wide. Another thing, if manure is put in an eight inch deep furrow you would plow nearly all of it up when you commence to plow in February. Before I commence on it I would also like to know if the plan I had in mind would be in any way harmful. It is as follows: Dig a ditch along the drip of the tree, the way I irrigate, about 18 inches deep, and fill the ditch with manure to within six inches of top and then cover with soil. Ditch would be 18 inches wide also.—Subscriber, San Fernando.

Mr. Shamel answers: The five cubic feet of stable manure or its equivalent in other organic matter is distributed on both sides of each tree in the furrows. Furrows best adapted for this purpose are made with a middle buster type of plow which throws out the soil so as to leave a wide and clean furrow. These furrows, made by several makes of plows especially adapted for this purpose, are often from six to

eight inches in width near the bottom and from 10 to 14 inches across near the top. In such furrows it is easily possible to distribute two and one-half cubic feet of stable manure on each side of the tree or five cubic feet for each tree. Some growers report that they have used from 10 to 15 cubic feet of manure per tree in such furrows. If manure is distributed in the fall or winter it decomposes to such an extent that by the time of spring plowing little or none is likely to be pulled out. Of course, if the manure is distributed in the furrows shortly before plowing or cultivating, some of it is likely to be turned or pulled out when the land is plowed or cultivated. In this case the furrows should be deeper than ordinary in order to avoid disturbing the buried manure. As the buried manure decomposes, as it does rather rapidly under favorable conditions in our orchards, the danger of disturbing it by cultivation is soon removed. An examination of the manure in the furrows several weeks after its distribution where it has been kept moist usually reveals only the dark decomposed matter as a thin line near the bottom of the furrows. I think that the cost of digging 18 inch furrows or trenches would be almost prohibitive under most conditions. Furthermore, my experience has been that this depth is not as efficient as a more shallow one. It would be desirable perhaps to try it as an experiment, particularly if it was compared with a shallower furrow. Eight or ten inches under ordinary conditions breaks through or breaks up the plow sole, if present, and when the manure decomuoses it is usually out of danger of being seriously disturbed by subsequent cultivations. I am also of the opinion that reasonable and rather frequent applications of manure are likely to be preferable to very large amounts used at infrequent intervals.

Protecting Citrus Trees

Please tell me the best methods of protecting citrus trees against the cold. I am wrapping or rather covering them with sorghum stalks on the south and east sides and leaving the northwest open and have been told that if we keep the sun from shining on them the next day that even 10 or 12 degrees below freezing will not injure them. How many degrees of freezing will a young citrus tree stand if kept shielded from the rays of the sun the next day?—Subscriber, Brownsville, Texas.

The degree of cold which citrus trees will stand depends upon the weather, condition, variety and age of the trees. The first factor with this we take it would be the variety. From what we have been told we believe the Texas planting of citrus trees is usually of the Satsuma orange. This of course will stand far lower temperatures than the Navel or Valencia. Neither of these varieties would tolerate the temperature mentioned for any length of time. The protection suggested by the inquirer is perhaps the best that can be secured unless one can provide regular orchard heating equipment. We would suggest to our Texas citrus grower that he write the Texas Agricultural Experiment Station, Beeville Substation, Beeville, Texas, and ask for Bulletin No. 148, "Report on Experiments with Citrus Fruits at the Beeville Substation," by A. T. Potts.

Castor Beans

I would like to find out all about castor beans, how they produce in rich silt land and how they are grown and harvested.—Subscriber, Linden.

Castor beans do best in the rich silt land though they will tolerate and thrive in coarser, gravelly soil. In fact soil is not so much a consideration in the castor bean industry as markets. Under stress of war demands Californians grew a limited quantity of beans in 1917 and 1918. The return was far from satisfactory and presumably castor bean culture will never be general in this state.

Weed Pests

My neighbors, by carelessness and lack of cultivating, raise plenty of tumble weeds, also sand berries, all over their fields. Whenever the northwest wind comes up it brings all that mass into my vineyard. Can I make them clean that up or keep that stuff off of my place?—Subscriber, Wasco.

We think you may secure relief by reporting the matter to your horticultural commissioner at Bakersfield. He has power to enforce the cleaning up of certain weed pests and while tumble weeds may not be included in those pests the commissioner may be able to make suggestion as to proper steps to take in this matter. Of course without question there is cause for damage in this case, but to prove the amount of damage is sometimes difficult.

CONCRETE UNIVERSALLY SATISFACTORY

In the gradual evolution of irrigation from the open ditch to the wooden flume, then to the concrete flume and finally to the underground concrete pipe, it has been the experience of irrigationists that completely successful results are dependent to a large extent upon the concrete pipe being of a proper quality.

The manufacturers who originated the valve system of irrigation, which method first made use of concrete pipe, learned through broad experience over a long period of years the importance of this principle; and, with a view to insuring a proper quality of concrete pipe and thus protecting the ranchers in the installation of an irrigation system which will prove permanent, manufacture also a concrete mixer, which is reported to be absolutely efficient and dependable in every way.

One type of these mixers is specially designed for mixing concrete for use in pipe manufacture, another for use in general building construction, and a third for a combination of the two types. This combination mixer is designed for use on jobs where small amounts of concrete or plaster are to be thoroughly mixed and is particularly adapted to use on ranches.

For building of foundations, irrigation systems, silos and even entire buildings concrete has come to be almost universally accepted as an entirely satisfactory material in California. In this state where weather conditions are not extreme there is little trouble caused by frost or moisture.

Extensive tests have been made to determine the percentage of loss of water through seepage and pressure in concrete pipe, and it has been shown that where the formula is right and concrete carefully mixed there is comparatively little loss. Concrete silos have proven successful, and they are in use in certain sections of the state in considerable numbers.

For housing help some of the fruit exchanges have built considerable numbers of all concrete dwellings of small sizes and have found them economical to build, sanitary and durable. On every farm there is almost daily use for concrete for lining irrigation ditches and many other forms of construction.

Inexpensive machinery is available for making concrete blocks, bricks, pipe, etc., and very efficient concrete mixers are built sufficiently small to be practical for the average farm.

One feature which should be given careful consideration, however, is the mechanical construction of the mixer. Be sure that it is properly balanced and that it has ample bearing surface on the shaft in order that it can be operated with a minimum of power. It is advisable to have a concrete mixer built so that moving parts are easily changed for new ones when wear makes changes necessary. A great deal of the success in the use of concrete depends on the efficiency of the mixer. Use a good formula and mix thoroughly and the results will prove satisfactory and lasting as well as economical.

When every man's home is the sweetest place
On earth for a man to be;
When every man's wife is the sweetest wife
In all the world to see;
When every man's child is the dearest child
That ever drew breath—ah, then,
We shall have better children and women and homes
And a darned sight better men!
—Baltimore Sun.

The Martin Concrete Mixer

This is a small, sturdy Mixer designed for mixing small batches of concrete and plaster.

It is made by the Martin Iron Works, and with the reputation of the Martin Iron Works back of it.

All steel and iron—no wood.

PRICE $62.00

Can be furnished on trucks with motor or engine. Price for extras quoted upon request.

Martin Iron Works

1248 East 28th Street Los Angeles, Calif.

The Cultivator Patterns

3784. Misses' Dress—Cut in three sizes: 16, 18 and 20 years. An 18 year size requires 5⅞ yards of 40 inch material. The width of the skirt at the foot is about two yards. Price 10 cents.

3791. Girls' Coat—Cut in five sizes: 6, 8, 10, 12 and 14 years. A 10 year size will require 2¾ yards of 48 inch material. Price 10 cents.

3789. Ladies' House Dress—Cut in seven sizes: 34, 36, 38, 40, 42, 44 and 46 inches bust measure. A 38 inch size requirs 5⅝ yards of 36 inch material. The width at the foot is about 2¼ yards. Price 10 cents.

3756. Girls' Dress—Cut in four sizes: 4, 6, 8 and 10 years. A 6 year size will require 2⅝ yards of 27 inch material. Price 10 cents.

3801-3793. A Chic and Charming Design—Guimpe 3801 cut in seven sizes: 34, 36, 38, 40, 42, 44 and 46 inches bust measure. Dress 3793 cut in eight sizes: 34, 36, 38, 40, 42, 44, 46 and 48 inches bust measure. A 38 inch size requires 2⅝ yards of 36 inch material for the Guimpe, and 3⅜ yards for the Dress of 40 inch material. The width at the foot is about two yards. TWO separate patterns, 10 cents FOR EACH pattern.

3794. Girls' Dress—Cut in four sizes: 8, 10, 12 and 14 years. A 12 year size will require 1¾ yards of 27-inch material for the Guimpe and 3⅝ yards for the dress. Price 10 cents.

3400. An "Easy to Make" Apron—Cut in four sizes: Small, medium, large and extra large. A medium size will require 2¾ yards of 27 inch material. Price 10 cents.

3505. Child's Short Clothes Set—Cut in four sizes: 6 months to 1 year, 2, 3 and 4 years. A 1 year size will require 1¾ yards for the Dress, 1⅜ yards for the Petticoat, and ⅝ yard for the Drawers of 36 inch material. Price 10 cents.

PRICE OF ANY OF THE ABOVE PATTERNS 10 CENTS EACH

HOW TO ORDER PATTERNS

Write your name and address plainly in full, give correct number and size of each pattern you want, and send 10 cents in coin or (1 or 2 cents) stamps for each number. In order to furnish our readers with the very best NEW YORK styles, all patterns ordered are filled in NEW YORK. Do not expect patterns under **Two Weeks** from date of order.

CATALOGUE NOTICE

Send 15c in silver or stamps for or Up To Date Fall and Winter 1921 Catalogue, containing over 500 designs of Ladies', Misses' and Children's Patterns, a concise and comprehensive article on dressmaking, also some points for the needle (illustrating 30 of the various simple stitches) all valuable to the home dressmaker.

MY HEART IS BUT A LOWLY INN

My heart is but a lowly inn
Like that of old in Betlehem,
Where busy cares come wayfaring,
And vagrant fears their clamor bring,
And traders barter silk or gem.

And craving wants, like cattle dumb,
Wait at their stanchions to be fed,
While service, clad in homely clout,
All the long day speeds in and out
And late and weary creeps to bed.

Yet, Lord, if through the flushing night
I, too, may see Thy moving star,
And feel, as then, the air astir
With breath of frankincense and myrrh
By pilgrim wisdom brought from far;

And if the radiance grow and glow
Through every mean and humble place
Till, touched by that unscathing flame,
In penitence and tender shame
I know the Christ-child's beauteous face,

Then shall the drowsy servitors
Straightway arise and shout and sing,
And all my heart's poor hostelry,
Transformed by love and praise, shall be
A palace for the new-born King!—Mary A. P. Stansbury, in Christian Advocate.

FATHER 'N MOTHERTOWN

(Concluded.)

The next two days did not leap ahead as to a joyous third day but somehow they passed. Sarah had paid the rent of her bargains in advance and her inherited sense of thrift would not let her "waste" the money. To Asher's silent astonishment, she installed the poor useless bargains in the living room. The cookies she set away in a stone crock but the cooky man broke her heart. She did not unmake Aurora's bed because she could not bring herself to go into that little ready room.

Aurora herself was very busy getting ready to take the new and magic train. Aunt Roxanna was a dear! A whole hotel week of sights, sights! The Great White Way on Christmas eve!

She had been obliged to write home hurriedly but she promised herself she would write every day from the city, between sights. She would tell Father and Mother all about everything and send them something New York-y and Christmasy. Father and Mother were dears, too. Everybody was dear. So excited and thrilled was the real Aurora that she did not think to turn upon the other Aurora and demand if she thought she was dear!

At the station at last Aurora found that her magic train was an hour late. A girl about her own age was waiting too. It was no one Aurora knew. The girl was nervous and kept walking about. She walked up to Aurora.

"Oh, could you tell me which track the train to Podunk's Corner goes out on? I don't suppose you know where Podunk's Corner is but it's home. It's where I'm goin'! Mother's goin' to be terrible surprised. An' tickled—goodness! You see I'm in a ten-cent store and this is our busiest time but I fainted dead away so I'm going home. They let me. That was a pretty lucky faint! I needn't tell mother that. I don't suppose you're surprising your mother? I bet she's all cooked up for you! I bet she's a tickled mother too!"

The girl danced away to the other end of the room and studied a huge train list decorating the wall. She moved elastically, joyously; she did not seem in peril of fainting now. Suddenly she cried out in pleased enlightenment:

"I've found it! Here's a place not a great way from Podunk's on the same road. Goodness, of course it is Berrytown! I guess I wouldn't forget Berrytown. When I was little I went there and thought it was Boston or New York. We've got one store at Podunk's."

There were 29 in Berrytown. Aurora reckoned rapidly in her mind. Berrytown was Father 'n' Mothertown. The girl was dancing back now.

"Berrytown's where my father and mother live," Aurora found herself saying to her. "There are 29 stores if you count old granddaddy Jim's cobbler shanty."

"Your town? Honest? Then we'll go together! I get off first, you see," explained the ten-cent girl. "I didn't come here on the railroad or I hope I wouldn't be such a goop's not to know how to go back. I came all the way by trolley because it was cheaper. I saved a whole hat!"

The train that went to Father 'n' Mothertown was whistling down the line. It was ahead of the belated express to New York and Aunt Roxanna and the sights.

"Is that our train? I'm beginning to get excited." As if she had not been all along! "Come on out on the platform ready to jump on. It's a race for mothers, isn't it? An' I'll beat and my mother will be more surprised than yours!"

Wait! What would Mother say if in spite of Aunt Roxanna and the sights—Aurora started as though she had heard Mother saying, "My girl! My girl!" She saw Mother's radiant, surprised face. Little stoopy old fashioned Mother——

"Aren't you coming? Here's our train!" chattered the girl outside, poising an instant in the doorway.

"I'm coming!" Aurora called.

The ending of that journey was to be more unexpected even than its beginning to Aurora Potter. It was to be a journey of adventure, unhappy and undreamed of. For the train to Father 'n' Mothertown ran into a drifting, clogging snowstorm. Hour by hour passed, difficulty of passage increasing. The train was crawling when it reached the little flag station of Podunk.

"Good-bye!" the ten cent girl said. "I wish you was home, too. I'm there! Our house is just a little speck of a way off. See that light? You poor thing—it's stormin' big guns. Good-bye!" She was off.

Suddenly, after a gallant charge ahead into the teeth of the storm and a victory of a few more miles, all progress ceased. Something had given out or the engine had lost its

Let us hold fast the Christmas spirit for 365 days.

courage and its nerve. The trainmen consulted and shook their heads.

"Stuck!" proclaimed the conductor. "Engine called a strike. There's some kind of a big building out there if anybody wants to make a try for it. I'll go with 'em. Or you can snuggle down in the seats here."

Only Aurora wanted to make a "try" for the big building. She would not stay in this stuffy car! Ten minutes later she was getting her breath in a big bare lighted room, a kindly woman trying to assist.

"Some storm, ain't it? Sit right down. I'll get you something hot."

It was good strong ginger tea and as Aurora sipped and smarted and "warmed up" the woman talked steadily on, excited and pleased by her part of the adventure.

"This is the poorhouse. I don't suppose you mind shelterin' in the poorhouse, do you, not in this storm? We're all out of paupers anyway. I've been here 17 years and we never had more'n two or three at a time. I tell 'em I remember every livin' one an' which was tallest an' shortest an' homeliest and han'somest.

"The han'somest pauper looked a lot the way you do, I declare. Just about the same age an' all, the prettiest thing! She was our star pauper——"

Aurora choked a little over the ginger tea.

"I declare, same looks! She warn't here but two or three weeks an' died an' somebody took her little baby. I remember plain how glad I was for it to have a reg'lar home to grow up in, instid of a poorhouse. The poor mother didn't only have time to kiss it an' name it an' die for it. She wouldn't give it any last name and the first one was terribly outlandish. I told 'em she thought she's makin' up to the baby."

The cup was empty and Aurora set it down. For politeness' sake she entered the conversation.

"What was the name?"

"I can't remember. I tell 'em that's the only thing I ever forgot. Specializin' so in paupers."

"Was it a good while ago?" Aurora's question was put to stem the returning tide.

"Seventeen years. I remember the date plain. But the outlandish little

Oil Light Beats Electric or Gas

Burns 94% Air

A new oil lamp that gives an amazingly brilliant, soft, white light, even better than gas or electricity, has been tested by the U. S. Government and 35 leading universities and found to be superior to 10 ordinary oil lamps. It burns without odor, smoke or noise—no pumping up, is simple, clean, safe. Burns 94% air and 6% common kerosene (coal-oil).

The inventor, W. V. Johnson, 31 N. Fifth St., Portland, Ore., is offering to send a lamp on 10 day's FREE trial, or even to give one FREE to the first user in each locality who will help him introduce it. Write him today for full particulars. Also ask him to explain how you can get the agency, and without experience or money make $250 to $500 per month.

Save 1-2 on Fuel

CHEAPEST HEAT YOU CAN BUY

The Sievert Oil Burner burns either distillate or kerosene oil in cook stoves, heaters, furnaces, pasteurizers, boilers, prune dippers, dairy sterilizers, etc. Absolutely safe, odorless, very convenient and low priced. MAKES HEAT AT HALF WHAT WOOD AND COAL COSTS. Install it yourself. Write for circular and prices on different sizes. Address Sievert Oil Burner Co., 710 North Main St., Los Angeles.

name — it meant light, I remember that."

"Meant what?"

"Light, brightness — somethin' like that, she said. She was such a foolish little thing I don't believe she knew what it did mean. I don't know's she was all there. But Mis' Potter was goin' to keep the name she said. She said——"

"Tell me—tell me that date," Aurora said thickly. Her blood pounded in her temples. What was this thing she was going to find out? She would shut her ears, she would plow her way back to the stalled train out there!

It was her date.

Mis' Potter was Mrs. Asher Potter of Berrytown. Aurora sank back in the pauper chair and struggled with thoughts. They swarmed up over the bulwarks of her pride. Her secure little city of life was taken.

That was what Mother had done for her. Oh, she was "Mother!"

It was Christmas eve. She wanted to see Mother. She wanted to see Father. She wanted to hang her stocking up! She wanted to put her face in Mother's neck and be glad she had come home instead of going to New York.

Bells jingled outside. A powdered snow man bustled into the room.

"Well, if I don't declare! What do you think you're doin' out o' doors!"

"Give me a boiling hot drink. I've got to go on to Berrytown—very sick patient. A snow shovel too. I'll have to shovel my way through the drifts."

On her feet a starry eyed young creature faced him.

"I'll help shovel. I've got basket ball arms. I've got to go to Berrytown too."

They went together to the sick patient and to Mother. Aurora never forgot the sleighride nor the aching young muscles, for she insisted on doing her turns. She gloried in her basket ball arms. She gloried in the sting of the wind and the snow in her face. She was going home to Mother.

It sang in her heart like a beautiful warm tune in that tempestuous cold.

"My girl! My girl!" She had known Mother would say that and shine like that!

"Asher, she's come! Aurory's come! She's snowed down. Oh, Asher, do you think you could hobble in and set a match to the living room grate while I undo my girl?"

It was Mother who stole in a little later and set the Welcome Home music going. It came tenderly to Aurora.

The girl had made her decision on the way home.

She would not let Mother know she knew; instinctively she realized the comfort it had been to Mother to spare her girl that humble enlightenment. She would spare Mother but she would put her face in Mother's neck.

"Do you hear what it's playing, Aurory? It's playing Welcome Home to Christmas!"

Aurora did it then. Her face was wet in Mother's neck.

The stocking was hung and yet the happy three lingered in the firelit room. Aurora was looking among the records Mother had rented. Suddenly she caught one up and put it in the machine. She turned the handle eagerly. Aurora was used to machines. Presently a sweet and tender song began. It was Aurora's soul singing, too, in accompaniment:

"I love the dear silver that shines in your hair,
And the brow that's all furrowed and wrinkled with care;
I kiss the dear fingers, so toilworn for me,
Oh, God bless you and keep you, Mother Machree!"

CHRISTMAS WISHES

"These are the gifts I would wish you, borne upon swift wings of love;
Courage and Patience and Purpose, steadfast as planets above;
Work for the long hours of waiting, Peace in the interval's rest,
Joy in each morning's awaking, Gladness when gladness is best."

"'Tis the thought of a friend
To the heart of a friend,
And Hope in the thinking.
The prayer of a friend
To the God of a friend,
And Faith and Believing."

Sing the song of great joy that the angels began.
Sing of glory to God and of good will to man.

LEFTOVERS FROM THE CHRISTMAS TURKEY

Turkey Soup

Take bones and scraps left from roast turkey. Scrape meat from the bones and lay aside any nice pieces no matter how small. Remove all stuffing and keep it separate. Break bones and pack closely in kettle. Cover with cold water. Add 1 small onion, sliced, 1 teaspoon salt and a little pepper. Simmer two or three hours until the bones are clean. Strain and remove the fat. Put liquor on to boil again and add for every quart of liquor 1 cup cold meat cut fine, and half a cup of stuffing. If the stuffing is omitted thicken the soup with flour. Simmer until meat is tender and serve at once. This is better than boiling meat, bones and stuffing together. The stuffing absorbs the oil and gives the soup a strong flavor.

Scalloped Turkey

Make one cup sauce, using 2 tablespoons butter, 2 tablespoons flour, ¼ teaspoon salt, few grains pepper and 1 cup stock. Cut meat into small pieces. Sprinkle bottom of buttered baking dish with seasoned cracker crumbs

> It's a beautiful season if we make it so.

and turkey meat, pour over sauce and sprinkle with buttered cracker crumbs. Bake in hot oven until crumbs are brown. For this amount of sauce about a cup and one-half of the meat should be used.

Minced Turkey

To one cup cold roast turkey meat cut into small pieces use 1-3 cup soft stale bread crumbs. Make one cup sauce as by above recipe. Season with salt, pepper and onion juice. Heat turkey and bread crumbs in sauce. Serve on small pieces of toast and garnish with poached eggs.

A HOLIDAY PARTY

An indoor nutting party may be arranged by decorating a small tree with bags of nuts of all kinds. If you can't get a real tree, use a tall clothes tree, to which branches or leaves are wired. This tree may be as Christmasy as you wish. There should be a candle on top, and a few sprigs of holly among the branches.

The bags that hold the nuts are of all sizes and fabrics. The guests at a signal are told to strip the tree and the person who secures the greatest number of nuts is promised a reward. The joke is that the larger bags do not contain the greatest number of nuts, for some of the bags hold lone coconuts or doughnuts. Some very small bags hold quite a number of peanuts. The nuts are all counted before the prize is awarded.

SOME SIMPLE SOUPS

By Mrs. Robt. L. Davis, Reedley

A favorite soup in my household is a vegetable beef soup which admits of many variations. The foundation is as follows:

Vegetable Soup

Get a joint and part of the shank with a marrow bone. Put on to boil in cold water in a deep vessel. Watch closely when it boils and skim well.

Prepare vegetables and put in as soon as the skimming is finished, and cook all together for several hours—on back of stove is best.

Be sure to use onions, tomatoes and potatoes. Turnips, cabbage and celery, if desired, add much to the flavor; also green peppers, corn, celery root and chopped parsley. Just before taking up, chopped green onions are good. When ready to serve the soup may be thickened if desired. The bones should be taken out when the meat has slipped off. Add salt to taste when meat is cooked. The broth may be strained and served as clear soup, the thick part put through a sieve and served as puree or poured over cooked macaroni or spaghetti, the meat taken out, chopped and added to this dish. If desired the tureen may be rubbed with a slice of garlic. This soup is conveniently made on baking day as it requires no attention after vegetables are put in and salt to taste is added.

Asparagus Soup

Asparagus should be put on to cook in boiling salted water for five minutes, then this water poured off and more water added. When cooked till tender take out asparagus and prepare for serving as desired.

To the broth add a cup of soup stock and you will have a deliciously flavored clear soup. Or add a cup of new milk or thin cream, thicken with flour and water thickening, add a tablespoon butter and you have a fine asparagus cream soup suitable for any dinner.

Tomato Soup

Put a cup of canned tomatoes through a strainer and add two cups soup stock. Season with salt and pepper. Chop very fine small green onions, parsley leaves and a few tender celery stalks; put into tureen or soup plates, pour hot soup over and serve at once.

THE SINK EFFICIENT

This is the very suggestive title of an article by Mildred Maddocks in November "Good Housekeeping." It will have particular appeal to the woman of medium and over-medium height, for the old fashioned sink seemed almost universally to have been built for little people.

"The selection of a kitchen sink does not so much concern the question of materials as it does the design of the sink itself. It should of course be selected of one of the sanitary materials. But above all it should be of a double drainboard design. This not only proves more convenient in washing dishes but actually saves breakage. In the single drainboard sink there is a tendency to pack soiled dishes in the sink around the dishpan and it is here that the nicking and breaking occur. If the soiled dishes could be packed neatly at the right of the worker and washed toward the left, or vice versa, depending upon the direction of the dining room door, there would be no tendency to crowd the dishes in the sink, and breakage would be actually reduced.

"No other expenditure would repay you quite so much as the installing of your kitchen sink at the proper height for most convenient work. This height can vary only to a limited extent. A sink set 35 inches from the floor to the bottom of the sink is convenient for workers ranging from five feet to five feet six. We consider, therefore, that 34 inches is as low as a sink can be set and still enable the worker to stand straight with no strain on the muscles of the back, only the shoulder or upper arm muscles being involved in work done at the sink.

"Therefore, even if the sink which you have is satisfactory as to material and design, yet is too low in height, an expenditure required for raising it will be amply compensated. If you measure only a total of two hours a day at the sink, still the tired back muscles will react during the entire day. Its cost is the plumber's time plus the cost of the increased plumbing, and it is an outlay that can fairly be reckoned as an investment to any owner of a home. It is an outlay that is warranted even in a rented home, through the individual return in comfort to the tenant. It is possible to secure on the market sinks that can be set with leg supports at the proper height, but if you should have one without length enough in the leg support, supplement it with plain metal piping. This can be painted and enameled so that it can hardly be distinguished from the sink design."

The message of Christmas morning is as universal as it is personal and present. It is addressed to each man; it is addressed to all men. It is destined to shape the private conduct and to impress and mould the life of society. Divine in its content, it has an earthly relation and significance; whilst holding out a promise of the greater things which shall be revealed in us hereafter, it is not without action in time and influence upon the world around us.—Cardinal Gibbons.

There is nothing that people will thank us more for at Christmas time than a little pains taken to understand them.

The California Plan of Livestock Auctions

By R. P. Royce

IT WILL be recalled that in former articles dealing with the matter of public sales of livestock one of the abuses mentioned as having caused considerable grief in Eastern states was the domination of breeders by a certain class of auctioneers, field men and agricultural journals. This domination operated to the end that breeders were sandbagged into spending money for advertising and other sale expenses out of all proportion to the volume of business transacted.

Hundreds of instances might be cited to substantiate the above claim. As a matter of fact during the "boom times" of recent years the game of bleeding the breeders grew to such proportions that more than one of the leading Eastern agricultural journals voiced a protest over the activities of their less scrupulous contemporaries.

One of the ideas back of the formation of the California Breeders Sales and Pedigree Company was to head off any such practices in this state, and for the most part the plan received the support of the principal publishers who were anxious to see the livestock business developed along sound and practical lines and who, fortunately, did not look to the business solely as a new field in which to develop advertising accounts. From the first the California Cultivator organization regarded the California plan as essentially sound and has never seen any reason for withholding support. The journal has solicited sale advertising on the same basis as other business. We believe that all California agricultural journals and papers save one have followed the same policy. That particular journal has, almost from the beginning, sought to disrupt the organization. During all their activity, notwithstanding the fact that from time to time information came to hand that representatives of the paper in question were continually shying bricks our way, no protest has been made for the simple reason that such attacks were in no way hurting our standing with the livestock fraternity, which in general was aware of the motive; but since this journal has veered its attack to the California Holstein Association; has editorially charged that the public sale business of California is a "well stacked game" and that the California Cultivator is the apologist for and promoter of such a game, and that we enjoy a "special privilege," we can be pardoned for setting forth the facts—not for the benefit of the established breeders, for such men are already informed, but for the information of men just entering or considering engaging in the purebred livestock business.

At the time the California Breeders Sales and Pedigree Company was organized by a group of breeders, C. L. Hughes, then publisher of the Livestock and Dairy Journal, was importuned to accept the management of the new organization. In order to accept the position he found it necessary to dispose of his publication and it was offered to the publisher who has since been most active in attempting to discredit the California plan. The offer was flatly refused. Subsequently the publisher of the California Cultivator purchased the Livestock and Dairy Journal. The purchase was nothing more than a business deal and carried with it nothing but the name, subscription list and good will.

At the time of consolidation this publisher referred to paid his respects in the following neighborly fashion: "The Livestock Journal, recently of Sacramento, fell into the cutter and has been conminuted and blown into the silo of one of our southern contemporaries, where it will ferment into oblivion, along with other journalistic stover which had previously taken the same course."

Since that time the aforementioned publisher has waged a lone fight on the efforts of California breeders to set up and operate a selling organization. In view of the fact that that paper has constituted the only opposition encountered it may be pertinent to inquire as to its motives.

It would seem that the only reason justifying criticism would be based on the failure of such a selling plan to render protection to the buyer or satisfactory service to the seller.

It has been demonstrated in former articles that no plan in America affords the public sale patron as much protection as is available under the California plan, therefore there can be no legitimate criticism on that score. From the seller's standpoint the success or failure of a selling plan is determined by the financial results of a sale. The fact that 95 per cent of the registered cattle sales of California have been held through this service, and that the breeders themselves, with but a few exceptions, were entirely satisfied, would indicate that there is no ground for criticism on that score.

The only other motive actuating opposition to such a plan must rest in the desire to gain a selfish advantage not obtainable under existing conditions. The only manner a journal can profit through the sale of livestock, aside from service to its readers, is from advertising receipts. It can be taken for granted then that when a journal, finding no ground for complaint as to services rendered buyers and sellers, wages a continual war on such a plan that it does so because of a desire to increase its revenues.

Another fact that leads to this conclusion is the fact that of all the California agricultural and livestock journals, that heretofore mentioned is the only one to raise a howl. Can it be assumed that it alone is the sole protector of the livestock industry and that all other journals are incompetent to the point of having the wool pulled over their eyes? The plain, unvarnished truth is that many breeders are convinced that the paper referred to seeks to undermine the sales organization for the reason that to date it has been unable to jimmy large amounts of advertising.

In order to create dissension and opposition its activities have taken devious ways.

One of the first arguments used was to the point that the plan of selling through a central agency had little to recommend it. That under such a plan the seller lost his individuality and had too little to say in regard to the management. About the time registered beef cattle sales were initiated in California, this publisher began to see some merit in the new plan and he dispatched emissaries about the state in an effort to interest owners of Shorthorns and Herefords in forming a sales organization to handle beef cattle. The argument used was that an organization dealing principally in dairy cattle sales could not render efficient service to beef cattle breeders. No progress along that line has been made.

Occasionally they charged that the sales manager received a rebate on advertising placed in the Cultivator and pointed to the fact that his name appeared as an associate editor in our livestock department. They still maintain that such connection gives this journal undue advantage over other journals. We don't know—maybe it does; at least our contemporary ought to know from experience whether or not such prestige is worth anything—they enjoyed the rare privilege of using a dean of the University as editor for many years.

More recently our indignant friends became convinced that the Holstein-Friesian breed was about to be wrecked in California because the sales manager of the California Breeders Sales and Pedigree Company was also secretary of the California Holstein-Friesian Association.

About the time that idea developed representatives of our contemporary interested themselves in the local association of Holstein breeders of Stanislaus County and for nearly two years have aided, abetted and otherwise encouraged that group of breeders to develop a Holstein selling organization. Attempts have been made to convey the idea that the Stanislaus County breeders have been unfairly treated by the state association. The motive back of our contemporary's activity on behalf of the Stanislaus association is pretty generally understood by everyone save the members of that association. The interested attitude of our friends is due to the fact that, after being rebuffed every time they have attempted to destroy the efficiency of the established selling organization, they seized upon the county association in the hope that they could use that organization as a pry to greater advertising appropriations.

The charge that the business of selling registered cattle in California is in the hands "of an inner circle" that gets a "rake-off from what an outer circle produces" is not only laughable but untrue. That this journal enjoys any special privilege at the hands of the California Breeders Sales and Pedigree Company is equally false and is based on nothing more than a narrow minded envy generated by the fact that this journal, through liberal and fair policies,

TRAVIS B. MINGS
HOLSTEIN DISPERSAL
65 Registered Cows and Heifers
El Monte, Calif. Thursday, January 5, at 10 A.M.

Fay Tritomia Hengerveld, a 30 lb. daughter of Mutual Fobes Longfield De Kol, selling heavy with calf to a richly bred son of Sir Pietertje Ormsby Mercedes.

Marion Hengerveld Pontiac, out of Fay Tritomia Hengerveld, the 30 lb. cow shown at left, and sired by the $12,000 bull, King Korndyke Pontiac 20th.

In the face of a strong demand for registered Holsteins there is almost the assured fact that fewer of these cattle will be offered for sale in California during 1922 than for any of the past five years. Buyers will therefore use good judgment in attending the early sales of the year.

Mr. Mings is dispersing an excellent herd, rated on breeding, type, production, and the attractive physical condition in which they will be offered.

Every animal is guaranteed a breeder, every one over six months old tuberculin tested and sold subject to retest by the buyer.

The sale managers, California Breeders Sales and Pedigree Co., will extend the usual liberal terms of one-third cash, balance in 3, 6 and 9 months to responsible parties who arrange for credit before sale.

Among some of the good ones in the sale are:

Four daughters of the $12,000 bull, King Korndyke Pontiac 20th.

Four granddaughters of the four times grand champion Bridgford bull, King Segis Alcartra Prilly, sired by one of his 30 lb. sons, a full brother to the junior champion at the 1920 California National.

Five granddaughters of Maid Tuebie Segis, the great cow that made 1,140 lbs. butter from 28,383 lbs. milk in one year.

Several daughters of King Segis Pontiac Jannek, the grand champion in this year's Southern California shows.

Over twenty cows and heifers with official records up to over 30 lbs. butter in 7 days.

A granddaughter of Adirondac Wietske Dairy Maid, whose 41 lb. record is the largest ever made on the Pacific Coast.

The sale will be held on Mr. Mings' farm, two miles south of El Monte, under cover, rain or shine.

RHOADES & RHOADES will be the Auctioneers.

Applications for catalogs or credit should be addressed to the Sale Managers, California Breeders Sales and Pedigree Co. 211-212 Ochsner Bldg., Sacramento, Calif.

enjoys wider support at the hands of California breeders.

The California Cultivator has never at any time participated in the formation, or attempted formation, of any selling organization, whereas our friends who set up the whine of special privilege have on several occasions attempted to organize such agencies. Furthermore, various members of their staff have been urged as sales managers and not a few times have attempts been made to build a selling plan around an individual auctioneer.

LIGHTING FOR COUNTRY HOMES

By Charles E. Poyer

READERS of the California Cultivator who have gathered the idea that electric lighting is costly or inconvenient would do well to disillusionize themselves of this idea. It is a good idea to get rid of because it is apt to prevent one from enjoying to the full the many advantages and conveniences, as well as the safety from fire, which are offered by an efficient electric lighting system.

When Thomas A. Edison perfected the commercial electric light he foresaw a great future for it on the farm. He realized that it was not necessary for a rural home to be on a central station line in order to enjoy electric light and power. He spent many of the best years of his life in perfecting a storage battery lighting system for country homes.

Mr. Edison realized that a home lighting system would be used by persons who had not the time or inclination to study the technicalities of electricity and hence it would have to be simple, durable and "foolproof," as well as reliable and inexpensive to install and operate.

Electric lighting can be provided nowadays at reasonable expense for moderate sized houses, and service may be supplied for the full 24 hours without requiring the operation of the generating apparatus for more than a fraction of that time. Perfection of service and economy of operation are now combined. Country and city are alike the beneficiaries of modern progress in lighting methods.

There is an erroneous impression prevailing among some people to the effect that a home electric lighting system is hard to take care of. On the contrary, it is easier to look after than any other system of lighting, especially when you consider the trouble of filling and cleaning kerosene lamps and looking after other systems.

It is possible to have an electric lighting system of such a character that it is not necessary to operate a dynamo simultaneously with the generation of the light. With the storage battery the current may in effect be stored up to be used when the dynamo is quiet. The storage battery is charged by operating a dynamo. The battery then becomes a source of electricity which may be drawn upon at any time desired. With the best batteries no attention is required during the period when the current is being consumed. In the practical operation of a small electric lighting system this feature becomes of very great importance.

There is no reason why any owner of a rural home, if he desires it, cannot install an electric light plant at moderate cost, and the improvement in living conditions, convenience, cleanliness and freedom from fire risk make the original investment sink into insignificance by comparison.

THE CHRISTMAS TREE HARVEST

THE time of the great winter harvest is at hand, reports the forest service. It bears a crop requiring from five to 50 years to ripen. Arriving late by a single day it is worthless, yet its failure would mean sadness and disappointment to all the dwellers in childhoodland. It is the Christmas tree.

The history of Christmas tree usage extends far into the mists of antiquity and its origin is difficult to trace. Some say it is connected with the legendary Tree of Time, Ygdrasil, the great tree of Norse mythology, within whose roots and branches heaven and earth are bound. Some say the custom may be traced to the Egyptians who at the time of winter solstice decorated their portals with branches of the date palm, the symbol of life triumphant over death.

An ancient legend of the Scandinavians relates how the Christmas tree owes its origin to the "service-tree" which sprang from soil once drenched with the blood of two slain lovers and how each night during the Christmas season mysterious lights played among its branches. To this legend may perhaps be traced our custom of illuminating the tree when darkness comes. Among the Greeks, Christmas is known as the feast of lights.

To people of different localities the term Christmas tree may mean fir, spruce, pine, cedar, or even magnolia, for each region makes use of the most suitable species found near its markets. In the vicinity of Chicago a short needle pine found in Michigan and Wisconsin may be used. On the Pacific Coast the white fir finds favor while throughout Ohio Norway spruce is largely used. In Maryland and Virginia the scrub pine finds its way into many homes, and farther south cedar and holly.

But the Christmas tree de luxe is the balsam fir. Of little use for lumber, it possesses ideal characteristics for holiday purposes, beautiful and symmetrical with long horizontal branches and deep green foliage, each tiny leaf and bud of which sends out a breath of aromatic fragrance.

Yearly a crusade is started against the Christmas tree idea, usually protesting the waste of timber and the destruction caused to our young growth through their removal. The forest service in answer to these protests points out that 5,000,000 Christmas trees are used annually within the United States. Each year a "Christmas tree fleet" makes its way down Lake Michigan with a tree at the mast of each vessel in token of the cargo it carries.

Five million trees of the size used for the holiday festival is, relatively speaking, a drop in the bucket, for that number could be grown on 5,000 acres of land. The lumber industry cuts over a thousand times this acreage in a single year. If on December 25, 1921, the nation's timber cutters should begin work two hours late, the resulting decrease in acreage annually cut would be equal to the area exploited by the Christmas tree industry for the entire year.

The annual cutting of 5,000,000 trees is insignificant as compared with the loss through forest fires which each year sweep over 12,000,000 acres, causing a yearly wastage of about $20,000,000.

In addition, it is pointed out that the lands from which a large portion of the trees are taken is often more suitable for pasture and is more valuable after the timber crop has been removed than it was before. In the European forests the removal of Christmas mas trees is made to serve the welfare of the forests when at the holiday season the cutting of the small trees is in the nature of an improvement thrinning and at the same time a source of revenue. The removal of Christmas trees from our own national forests, under the supervision of forest officers, places a tidy sum in the nation's pocket each year and results in a more healthy and faster growing stand of timber remaining.

It has been demonstrated that by cutting Christmas trees of certain evergreen species above the lower whorl of branches the remaining limbs turn abruptly upward and often reach a height of six feet in less than two years. If a crop of Christmas trees can be cut without actually destroying the parent tree and a new crop sprouted within two or three years, the system may become of considerable economic importance to the industry.

But so far as discontinuing the Christmas tree is concerned, the foresters are against it. Their creed is to put each acre of ground and every tree to its highest use, and to what better use can a tree be put, they ask, than to bring joy to the hearts of children on their greatest holiday?

WINDBREAKS FOR AVOCADOS

Heavy winds prove destructive to avocado fruits and to the trees in general. The fruits are large, on long stems, and so are easily damaged by swaying and beating against surrounding twigs and branches. Leaf stems are brittle and break outright rather than part from twig at base of stem.

When visiting Yorba Linda orchards a few days ago, E. E. Knight told the writer his orchard and those of the district suffered severely, that he had just returned from an automobile trip extending from below San Diego to Ventura and that all orchards had been injured, though a few little pockets or coves had escaped. Mr. Knight strongly advocates planting boundary windbreaks of seedling avocados, the seeds to be taken from the best named varieties. These may be planted thickly and allowed to grow until fruiting or at least until too thick for healthful development. Then every other tree may be cut out or such trees as have not fruited or have borne inferior fruits. The avocado is so heavily foliaged, so large of leaf, that it is a good wind arrester, but when in fruit it is more vulnerable to crop damage than any other orchard tree.

MAKE YOUR OLD ROOF AS GOOD AS NEW

SUPER-TEST

(The Original California Made)

Asbestos Fibre Liquid Cement

DEFIES THE ELEMENTS

Made in five colors: Red, Black, Green, White, Gray.

Weatherproof, Waterproof, Fire Retarding, Prevents Corrosion, Preservative, Rust Proof, Easy to Apply, Sun Proof, Economical, Protective.

Will not run, crack or peel.

It will renew your old roof and save the cost of a new one. It fills and seals all holes, cracks and crevices. Especially adapted for shingle roofs.

$6.00 Barley Seed for $3.00 per hundred

The Heavy Yielding "4000" Variety That Withstands Drouth

If you raise barley, why not plant at least a little "4000" and improve your seed? You can also sell it for seed. It has proven to be around 20 per cent better than ordinary barley. Plump, heavy kernels insure good germination. It weathered a hard dry spell last year and came out vigorously. Seed cost $6.00; we sell it for $3.00 per hundred sacked F. O. B. Alpaugh.

J. W. McClarren Alpaugh, Calif.

VALUABLE SHORTHORN SAVED FROM BUTCHER

Users and Dealers Swear By "The Home Cow Doctor."

Here is a sample of the letters we receive every day from dairymen who would not think of getting along without Kow-Kare in the barn. Mrs. Harvey Ray, Homer, Ill., writes:

"I've thought for some time I'd write and tell you the happy results I secured from using Kow-Kare. Last winter I used it just as directed and the valuable Shorthorn cow, we would have been compelled to send to the butcher for what we could get is now safe in calf. I have also used the Bag-Balm with good results."

Barrenness, as well as most other cow diseases, Retained Afterbirth, Abortion, Scouring, Bunches, Milk Fever and Loss of Appetite have their origin in sluggish genital and digestive organs. These are just the organs Kow-Kare acts upon most promptly, toning up and creating healthy, normal action. The milk yield improves at once through this effective aid to the milk-making functions.

Don't wait for actual disease; use Kow-Kare on your poor milkers. It will work wonders and return many times its cost.

If you are out of Kow-Kare, go to your feed dealer, general store or druggist. They will give you the new reduced price—70c and $1.40

The Shell and Pea Game

By A. L. Spellmeyer

AT ALL rustic country fairs not a vast number of years ago there was a game played with a few shells and one small pea. The shorn were supposed to guess what shell covered the pea, but always guessed wrong.

Today in this United States the farmer who raises food and livestock is the shorn, the one who always loses, and he is forced to a gamble on every crop planted, on every livestock deal and on every turn, that no bank or other business in this great country would consider.

The livestock man is forced to gamble on drouth, on markets and against loss and disease. The killer doesn't gamble when he buys a steer nor the retailer when he sells it. To ask any business man to sell an article at cost would draw a mighty protest, but to ask a cattle man to sell an animal at a third of its cost is merely a usual custom in these times.

I know a man who planted string beans. He irrigated and cultivated industriously, then he planted and weeded and sprayed and cultivated. Finally he picked and hauled into the market and secured two cents the pound for his string beans from a produce merchant. Later in the day he visited a produce house and saw string beans sold wholesale at 6 cents the pound. That was one month ago.

I know of hundreds of acres planted to olives, costly land with costly water and bearing a good crop, but there is no sale for the olives, not even at picking cost. Yet oil is anywhere from $3 to $7 per gallon when you buy it.

Now I know many bean growers and I don't know one who did better than break even and many are broke. I have seen thousands of acres planted to sugar beets that grew a fine crop, unusually good, and did not pay the cost of it.

Why is the farmer forced to gamble for a living against odds he can't surmount? I have seen potatoes this year going to rot without sale at 50 cents per sack and within two weeks after the supply was bought up sell for $3. We have seen lemons dumped by the car and trainload in washes within a year and today we see lettuce and garden truck being dumped the same way. Big yellow pumpkins cover fields in districts where enough to gather and haul them cannot be realized. While the man with large association prune orchards and a drying climate or dehydrating plant now secures a good price, in the prune season I know men who could not sell their few acre crop for two cents per pound. The farmer must be a seer and crystal gazer in order to live or else be a fool for luck.

There is to pay on most California land interest on investment or rental on a valuation of $10 per acre on range land, and it takes 20 acres to feed one cow all year. Without taxes, labor or loss $16 goes into that cow in one year. The average yearly upkeep of California range cattle is closer to $20 than any other mark. In Arizona with $2 land and government grazing it's $10 a year or more. Today a man can get possibly $30 for a cow. He can get $14 for a calf for veal but would have to add $60 to that calf in order to sell it as a cow at $30. No other business in this land would keep on under such abuse and handicap.

Now if you want to build a house, every part of that material pays its cost and profit, and every man who handles it adds a percentage. The idea of selling all these materials at a 50 per cent loss would be intolerable. As a farmer said who came to a new district, he was sure happy and pleased, as he lost money there slower than he had lost it any place for several years.

While there is no question but that association marketing is the cure for these conditions as the present prosperity of the citrus, walnut and other such efforts fully prove, there is but one conclusion to draw, a change must come or our agricultural class will drift to the peonage and serfdom found in other countries.

At the present time our banks have reached the pinnacle of power and authority. Great food trusts control products, government is more costly each year, cities lower tax rates and increase amount collected. It's "Gamble for a living, you farmer or livestock man, and be darned, but we want ours or we won't do business." As there is always an up after a down perhaps a few years from now the producer may come into his innings, and if he does he will be out to collect.

Livestock News Notes

A wonderfully bred bull calf is the latest arrival in the herd of registered Holsteins owned by A. W. Morris & Sons Corporation, Woodland, born to the famous young cow, Miss Aaggie Acme Burke, and sired by Sir Aaggie De Kol Mead, one of the great sires owned jointly by the Morris firm and Fred Hartsook, Lankershim. This youngster has the tremendous average of 1137 pounds butter in one year for his seven nearest dams. It will be noted that he is out of the same dam as the $41,000 bull, King Korndyke Pontiac Acme, now heading Anita M. Baldwin's herd at Santa Anita. He is a beautiful calf about three-quarters white, and represents a small fortune in value.

When T. B. Mings, El Monte, disperses his herd of 65 head of registered Holsteins on January 5 there will be presented an opportunity to secure members of more famous families than are found in the average sale. Among the attractions are four daughters of the $12,000 bull, King Korndyke Pontiac 20th, two daughters of Prince Riverside Walker, the noted son of Aaggie Acme of Riverside, a granddaughter of Adirondac Wietske Dairy Maid, the great Bridgford cow whose 41 pound record is the largest ever made on the coast; four granddaughters of the four times grand champion Bridgford bull, King Segis Alcartra Prilly; several daughters of King Segis Pontiac Jannek, grand champion bull in this year's southern California shows, and a half sister to Lady Aaggie Ormsby of Rock, grand champion at this year's Pacific International at Portland.

Pottenger Sanatorium Co., Monrovia, has recently completed a number of excellent official records in its registered Holstein herd. Orndyke Duchess De Kol Gerben, a junior four year old, made 26.37 pounds butter from 620.5 pounds milk in 7 days, milking 109 pounds her best day. Miss Aralia Pontiac Burke, a 6 year old, made 25.89 pounds butter from 737.7 pounds milk in 7 days, milking as high as 115 pounds in one day. She went on test five weeks after calving, and in 30 days milked 3001.2 pounds. She is a daughter of Aralia De Kol Pontiac Segis, a son of Aralia De Kol, and her dam is Riverside Sadie Burke, a 954 pound yearly record daughter of Riverside Sadie De Kol Burke, thus giving her an average of 1060 pounds butter in one year for her three nearest dams. De Kol Gerben Orndyke Gem, a junior three year old, made 24.06 pounds butter in 7 days from 568.4 pounds milk, while her twin sister, De Kol Gerben Duchess Gem, just finished a 305 day record with 634 pounds butter from 17,050 pounds milk as a junior two year old. These last two heifers, and the 26 pound four year old noted above are all out of the same dam, De Kol Gerben Roxana Gem, a 22 pound daughter of the great Arizona sire, Roderick Lincoln. Lady Alice Juliana Burke, a mature age cow, made 21.48 pounds butter in 7 days. She is a daughter of Admiral Burke and Minnewawa Juliana 2nd. All four of the females recently completing 7 day records are being continued on yearly test, with Orndyke Duchess De Kol Gerben and Miss Aralia Pontiac Burke both keeping well over 100 pounds milk per day.

Everything points to a strong demand in California for registered Holsteins during the late winter and early spring. California Breeders' Sales and Pedigree Company has already had a number of inquiries as to the probable offerings after January 1, prospective buyers stating they have in mind purchases ranging from two or three head up to 30 head. While the demand expressed in these letters shows a partiality for producing cows or springers, there is also evident a market for heifers, as a great many are rightly figuring that the coming year will be an especially favorable time for the establishment of new breeding herds to take care of the enormously increasing demand for registered Holsteins in this state.

Members of California Holstein-Friesian Association have all been furnished with blanks upon which to report to the association the conduct of official test supervisors sent out by California agricultural college. It is intended through these reports to keep a more accurate check upon the men supervising tests, establishing more firmly the conscientious, capable men and uncovering the careless and those who are otherwise undesirable.

Announcement was recently made that no surplus resulted from the 1921 National Holstein Sale held at Syracuse, New York, last June, and there will consequently be no refund to the various states that consigned cattle. This was the second national cooperative sale, the first one held in St. Paul in 1920 having resulted in a surplus of around $30,000, of which the California Holstein-Friesian Association received over $5,600.

Dairymen in California are buying registered Holstein bulls consistently in spite of the weakness that developed in the bull end of the public sales toward the end of 1920. The owner of one of the largest herds of registered females in the state reports only one bull calf on hand, while another owner of a large herd, who had around 70

Byron Jackson Service

WHEN you buy a Byron Jackson deepwell turbine your purchase includes Byron Jackson service.

A service built on an engineering foundation that goes back to the very beginnings of irrigation in the west.

Starting in the factory testing department, this service accompanies the pump through the installation and down through the years of operation by means of a state-wide system of service cars.

Your water development problem is assured prompt and expert attention in our engineering department

BYRON JACKSON IRON WORKS-INC

Wherever water is to be lifted

408 Sharon Building
SAN FRANCISCO

bulls on hand late in the spring, has sold down to 15 calves. Dairymen everywhere want better cows and are gradually learning that the only way to get them is through the use of better registered bulls.

The demand for really good grade Holstein cows was never stronger than at present in California, and only the money shortage holds prices down. Rhoades & Rhoades, Los Angeles, recently sold one herd of 40 grade Holstein cows for an average of $199.65, and another of about the same size for an average of $220, both lots containing a few tail ends.

The animal husbandry division of the University of California has purchased a foundation flock of Cheviot sheep to be used for class and experimental work. Few, if any, flocks of this old breed are to be found in the West.

Fred Hartsook of Lankershim has added another world champion to the ranks of California Holsteins. Miss Aaggie Ormsby Segis, a senior two year old daughter of King Pontiac Ormsby Segis, passed the old record, of 19,060 pounds milk in 305 days, and in 284 days has to her credit 20,075 pounds milk. The final figures are not yet announced, but she will finish with a good margin. As noted above, she is a daughter of King Pontiac Ormsby Segis, a 31 pound son of King Pontiac Netherland Segis. Her dam is Moorland Josephine Colantha.

Rosamaines Pontiac Beauty, a senior yearling in the Hartsook Holstein herd, has just hung up the very creditable seven day record of 22.24 pounds butter eight months after calving. At present she is averaging close to 80 pounds milk per day.

From all reports another world record in the Holstein breed is on the way to a California herd. Bessie Veeman Alcartra Prilly, a senior two year old owned by the Bridgford Holstein Company, Patterson, promises to establish a new record in the 365 day division with an estimated production above 27,000 pounds milk. She is a daughter of King Segis Alcartra Prilly.

While attending the International Livestock Show at Chicago, Alex McDonald of the university farm purchased for T. S. Glide of Davis the junior Shorthorn bull calf Devide Raider. This youngster won his class and headed the winning young herd in a class of 15. He was sired by Meteor, a son of Edgecote Toft, and therefore a grandson of the celebrated sire, Earl of Kingston. His dam, a Bruce Mayflower, is Devide Marigold by Second Thought.

Howard Vaughn, Dixon, owner of the Mountain View herd of Shorthorns, is now en route from the East with a shipment of two carloads of Shorthorn females to add to his herd.

Ormondale Ranch, Redwood City, has purchased from Caledonia Farms, West Sacramento, the Shorthorn senior bull calf, The Caledonian, that went through the show circuit without defeat. He is a son of Imp. Caledonia and is out of Rosa Cumberland 2d. In addition to the Caledonia calf Ormondale has secured a two year old son of Imp. Kingwood from Thomas E. Wilson, Chicago packer.

One of the recent acquisitions to the herd of the Los Angeles County Farm has made good with a bang. Hollywood Lilith Palmyra Abbekerk, purchased from the Carnation Stock Farms at the California Guaranty Sale last spring, is the sixth daughter of her sire to make over 30 pounds butter in seven day test under full age. This record was made after calving at 4 years 9 months, when she produced 30.448 pounds butter from 685.9 pounds milk, or an average of 98 pounds milk per day. Her best day's milk was 106.1 pounds and her best seven days' milk was 704.8 pounds. Continued on 30 day test she made 125.019 pounds butter from 2902.7 pounds milk, showing unusual persistency.

CULTIVATOR PRIZE FOR NOVEMBER

By Prof. F. W. Woll

Five grade cows owned by W. F. Early of Grizzly Bluff, Humboldt County, had the highest average production of butterfat of similar groups in herds entered in the state dairy cow competition during the month of November, viz., 48.72 pounds, and the California Cultivator prize for that month was accordingly awarded to him. The production of the individual grades for the month was as follows:

	Days in Milk.	Milk Lbs.	Butterfat, %	Lbs.
Rosy, Mixed Grade..	241	837	6.9	57.75
Pencil, Mixed Gr.....	242	768	7.2	55.30
Lineback, Mixed Gr.	245	645	7.4	47.73
Little Darling, Gr. J.	253	627	6.8	42.64
Buck, Gr. J.....	245	423	9.5	40.19
	245	660	7.38	48.72

The prize winning grades were all mature cows and were either grade Jerseys or of mixed breeding with considerable Jersey blood. It will be seen that their production ranged from 40.19 to 57.75 pounds butterfat, the average production of milk being 660 pounds, with an average fat content of 7.38 per cent (average distance from calving at the beginning of the month, 245 days). These cows stood first among similar groups of five grades in 15 dairy herds in different parts of the state that competed for the Cultivator prize the past month.

The average production of five of the groups came to above 40 pounds butterfat for the month, viz.: W. F. Early, Grizzly Bluff, 48.72 pounds; M. L. Pontini, Arcata, 47.93 pounds; Peter Iversen, Grizzly Bluff, 47.79 pounds; J. A. Genzoli, Loleta, 46.90 pounds, and F. F. Pellissier, Whittier, 43.53 pounds.

This is the seventh time that the Cultivator prize goes to a Humboldt County dairyman, and honors are now even between this and Los Angeles County, as regards the award of this prize. Although no grade was considered more than once in the award of this prize, there is, however, this difference in the status of the two counties, that the prize was won by five different dairy farmers in Humboldt County and by three different Los Angeles County dairymen.

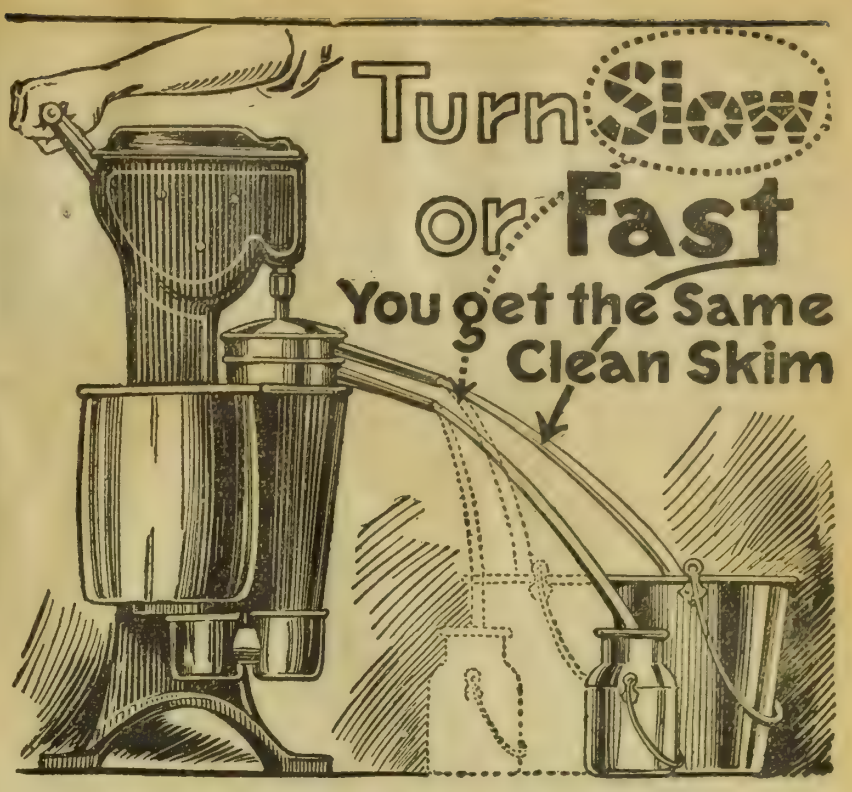
The production of the prize winning grades of the past month was especially remarkable on account of the advanced stage of lactation of the cows, as all had been milking over eight months. The average quantity of the milk produced by the grades was also remarkable, being extremely high, even for Jerseys.

U. C. STUDENTS WIN PRIZES

Osgood Lovekin, Riverside, freshman student in the college of agriculture of the state university, won first prize in the Saddle and Sirloin Club medal essay contest. The first prize was a $100 medal. Ralph Anderson, a freshman student from Oakland, won the third prize of $25 cash. This contest, which is open to all undergraduates in agricultural colleges in the United States, is one of the highest honors obtainable by agricultural college students. This is the first time that a University of California student has won this contest. The subject for the 1921 contest was, "Livestock as a Factor in Eliminating Waste in American Agriculture." The winning essay was chosen from over 100 turned in by students all over the United States. The committee choosing the winner was composed of several noted livestock men, including Dean C. C. Curtiss of the college of agriculture of Iowa state university.

EXPLANATION OF HIDE AND BRAND LAW

The California department of agriculture will shortly issue an explanatory synopsis of the hide and brand law and the act providing for the sale of estray branded cattle. The compilation, prepared under the direction of James B. Newsom, secretary cattle protection service of the department, is now running through the press and will be issued at an early date.



SHARPLES
SUCTION-FEED
CREAM SEPARATOR

IT SKIMS CLEAN AT *ANY* SPEED

You can "rest up" as you work, turning slowly and easy-like.

Or you can turn faster and finish quickly.

But no matter how fast or how slow you turn the Sharples, you'll find that the cream hasn't varied a bit in thickness, nor have you lost a particle of butterfat through turning under speed.

This is due to the Sharples Suction-feed principle. No other separator can use this principle as it is patented. All other separators are fixed-feed and when you turn fast your cream thickens, and when you turn below speed you lose butterfat.

Official tests made by nearly all agricultural colleges have proved that the Sharples skimmed clean at widely, varying speeds—without affecting thickness of cream at the varying speeds. Write for full report.

The Sharples Separator works *with* you as well as *for* you.

Get the facts about separators. They will show you the way to greater profits. Write to nearest branch.

PHOTO FINISHING

Send Your Favorite Negative and 40c, for 8x10 sample enlargement. Prints, any size, 4c each. WAGAR, Ukiah, California. Dept. E.

PHEASANTS

Beautiful Chinese Ringnecked Pheasants $12 per pair. Pause Pheasantry, Fairoaks, California.

TREES

Carob Trees—A fine beautiful evergreen legume tree, not a soil robber but a nitrogen feeder, unsurpassed for windbreaks in orange groves. No roots to cut. Produces two hundred to 1000 lbs. of richest food grown. $2.50 brings you 4 sample trees prepaid. R. 2, Box 60, Original Carob Nursery, San Bernardino, California.

For Sale—Placentia Perfection and Eureka grafted walnut trees. Prices 1-3 off from last season. Our stock is grafted from choice grafted orchards. See our stock before buying. The Walnut Nursery, Whittier, California. Phone 6294.

For Sale — Walnut Trees — Erhardt and Placentia grafted on Northern Black Root—4 to 6 feet high, $1.00; 6 to 8, $1.25; 8 to 10, $1.50; 12-14, $2.00; Erhardt, 8-10, $2.25; 10-12, $2.50. Borley and Wilkins, Puente, California. Phone 162.

For Sale—One and two year old citrus stock budded with "Supply Co. Buds." We have also all commercial varieties of deciduous. Now is the time to order. F. A. Tetley and Son, 415 W. 8th St., Riverside, Calif.

For Sale — Hachiya Persimmon Scions from best of 300 proven trees. Nursery is sold out, but will reserve for 22-23 season. Sherwood Persimmon Nursery, Box 236, Fullerton, California.

For Sale—Grafted walnut trees, also citrus and deciduous trees. Order now for 1922 delivery. Get my prices. Ketscher's Nursery, 1101 E. 4th Street, Santa Ana, California. Phone 572-W.

For Sale—10,000 Florida Sour Orange Seedbed stock, 12" and up. Valencia Late, Washington Navel, Eureka Lemon trees. Prices right. W. V. Skillman, R.F.D. Box 387, San Fernando, California.

Hachiya Persimmon Trees—Best of all Japanese persimmons. Also rhubarb plants for home and field. Fred W. Kelsey, S. Rosemead Avenue, El Monte, California.

Reliable Trees and grapevines at a fair price. Write us for price list. We ship on approval. J. F. Miller & Sons, Healdsburg, Cal.

Trees—Tuscan Kling peaches, Sugar and French prunes, five to eight foot trees $35.00 per hundred. Johnson's Nurseries, Almaden Road, Los Gatos, California.

For Sale—Grafted Walnut Trees, Placentia Perfection and Eureka. These are well rooted and first class in every way. Rivera, California, C. E. Bullock.

For Sale — ATHEL OR EVERGREEN TAMARIX. Best tree for immediate windbreak and shade in hot dry localities. Leonhardt Swingle, Indio, Cal.

Sampson Tangelo and Dwarf Chinese Lemon; the two best citrus products ever introduced. Coolidge Rare Plant Gardens, Pasadena, California.

For Sale—Walnut Trees. Placentia Perfection and Eureka, grafted on black root. La Puente Walnut Nursery, Puente, California. Phone 103.

Florida Sour Orange Seedlings. Nursery, 100 Ventura Street, Altadena. Address, Paul B. Magee, Mecca, California.

For Sale—Fruit Trees, grapevines, unrooted grape cuttings, etc. Write for price list. Burke's Nursery, Lodi, Cal.

For Sale—One and two year old Wonderful Pomegranate trees. fine stock. J. W. Irwin, Lindsay, California.

For Sale—California Black Walnut seedlings, 1-3 feet. Ripon Nursery Company, French Camp, California.

Bishop's Nursery, Highland, California, will be pleased to figure on your order for trees, plants, or seeds.

Citrus Nurseries, Murphy Oil Company, East Whittier California. Selected stock for sale; inspection invited.

Trees—Plant CHERRIES now for big income. Cash Nursery, Sebastopol.

CATTLE

Guernseys — Grape Wild Farms — Berkshires—Young bulls, from calf age up to 16 months old, of May Rose breeding and out of A. R. cows. Bred sows and gilts, service boars and pigs of both sexes for sale. Grape Wild Farms, Escalon, California. A. B. Humphrey, Proprietor.

Berylwood Stock Farm—Breeders of registered Holstein cattle and Duroc-Jersey swine. Every cow an A. R. O. and T. B. tested. Bulls and females for sale. J. W. Snodgrass, Hueneme, California.

Shorthorns bred for range purposes and of Pure Scotch Blood Lines. Show herd won highest honors in 1917. Visitors welcome; information cheerfully given. T. T. Miller, Hollister, California.

Extra Good Shorthorn Bulls ready for service. Red and Roans, well grown and priced to sell. Come and see them. Howard Vaughn, Dixon, Calif.

Yearly Record Holsteins—Bulls from 500 to 1000 pound dams and by World Record sires. A. W. Morris & Sons, Woodland, California.

Breeders of Registered Shorthorns—Milk strain; choice young stock for sale. John Lynch Ranch, Box 321, Petaluma.

Registered Holstein Bulls of various ages for sale. Millbrae Dairy, Millbrae, California.

Polled Herefords and Durocs — Diablo Stock Farm, G. W. Emmons, Prop., Danville, California.

Some Choice Registered Holstein heifers and bulls of serviceable age for sale. J. W. Scudder, Escalon, California.

TURKEYS

GIANT BRONZE TURKEYS

Large turkeys can be raised at practically same cost as small ones. It is in the strain. One of our toms will give you 5 more pounds of meat to market in all his get the first year, besides vitality and beauty.

GOLD NUGGET STRAIN
J. Will Blackman, Originator

Won at California's two greatest shows Gold Special Sweepstakes for best turkeys, California State Fair, 1920, against 66 of the State's best turkeys, also every 1st, 2nd and 3rd prize and Gold Special Sweepstakes at Los Angeles Livestock Show of 1920.

AN UNEQUALED RECORD

Toms and hens for sale; a few high class exhibition toms to win in any show or head any flock. Book orders early for December and January shipment, as each year we are sold out.

Address
BLACKMAN & MUMFORD
607 East Third St., Los Angeles, Cal.

Turkeys — Purebred Giant Bronze, male and female stock, sired by our two famous toms, "Goldbank Boy," champion Giant Bronze first prize winning cockerel at Madison Square Garden Show, New York, January, 1921, and "Copper King Jr.," a 36-lb. yearling son of "Copper King V.," the 38-lb. yearling that was grand champion at Madison Square Garden Show, January, 1919, both bred to choice 20-lb. hens. Eggs in season. Address Bronze King Mountain Farm, Calistoga, Cal.

If You Are Going to Start Something, Start Right—If you are in need of a Bronze turkey tom or several of them—we have them for sale. Big lustrous fellows all sired by winning toms and from our winners at State Fair and Oakland. A few pullets for sale, hens up to 25 lbs. We have only a few left. Get them now. Eggs in season. Mrs. D. T. Wieland, P. O. Box 21, Valley Home, Stanislaus County, California.

It's no wonder so many poultry raisers make a failure of the business. Without any knowledge of raising poultry people will branch out expecting to make a success. By putting in practice the valuable contents of POULTRY FOR PROFIT, $1.00 postpaid, success is assured in the poultry business. Cultivator Publishing Company, Los Angeles, California.

Mammoth Bronze Turkeys — Stafford strain Eastern stock, beautiful plumage, extra large frame and bone. Money back guarantee. Send for circular. R. M. Dodge & Son, R. D. 2, Box 129, Bakersfield, California.

Mammoth White Holland Turkeys—Choice hens and toms from our famous breed of large vigorous turkeys, improved by Eastern stock. Earl V. Smith, Loma Vista Ranch, Willows, California.

Pure Bred Bronze Young Toms, $15.00; young hens, $10.00. Pure bred S. C. Buff Orpington cocks, $5.00 each. Mrs. M. L. Trewhitt, Route B, Box 47, Hanford, California.

For Sale—Wild Turkeys—Best, cheapest, most certain and indispensable producers. Cash deposit secures stock or eggs. Blanche Dresser, Tulare, California. Route C, Box 194.

Mammoth Bronze Turkeys—Choice toms for sale. Prizes taken at Riverside Fair, 1921. E. H. Varley, Hemet, California.

Bourbon Red Turkeys, Buff Orpingtons. The Ferris Ranch, Reservoir Street, Pomona, California.

Thoroughbred White Holland Turkey Toms $12. Hens three for $20. Pause Pheasantry, Fairoaks, California.

WANTED

Wanted — Commercial orchard pruning. Work guaranteed. For rates address W. I. SCIBIRD, 2212 Nicholson Avenue, Monterey Park, California. Phone Alhambra 656W.

Wanted—Established California concern wants men, with rigs preferred, to represent it. Good pay. Can use local agents working during spare time also. Address J. H. Yetter, 317 Central Ave., Los Angeles.

Wanted to Buy—Any kind of dried fruit, honey or walnuts. Mail samples to W. A. Collins Co., Box 397, Santa Ana, California. Phone 71.

Wanted—Walnuts Meats and cull walnuts. We solicit culls for cracking only, paying cash. Fred L. Mitchell & Son, 214 French St., Santa Ana, California. Phone 551-M.

Cash Buyers want Western farms. Will deal with owners only. Write R. A. McNown, 370 Wilkinson Bldg., Omaha, Neb.

We Will Buy your Calla Lily roots. If you have 100 or more, write us. Sevin-Vincent Co., 512 Washington St., San Francisco, California.

Wanted—400 Splendor prune trees on Peach or Myro root. M. Sharpe, Vacaville, California.

HE COULD PROVE IT

"Well," said the waiter to the diner who had just had his coffee cup refilled for the seventh time, " you must be very fond of coffee."

"Yes, indeed," answered the student, "or I wouldn't be drinking so much water to get a little."—Lehigh Burr.

NO MIXED TRICKS

"Would you marry a widower, Maude?"

"No. I prefer to tame my husband hyself."—Judge.

AIR CLEANERS

Ranchers and contractors who are tractor owners are only recently beginning to understand the damage done to their motors when working in an atmosphere ful of sand and grit, and the value of an efficient air cleaner.

A motor first dass in every respect will wear out and be comparatively worthless in a very short time if allowed to work in a sand laden air. Unless there is an air cleaner attached that really cleans the air of all particles, the wear on the engine is increased many hundreds of times.

The dirt when taken through the air intake foils the carburetor and manifold, scores the walls of the cylinders and wears out piston rings. As is well known, grit will stick to any oily surface and will adhere until it is ground out by the moving parts. These surfaces are also being continually supplied by new particles taken in through the carburetor.

An air supply clean and free from dust to the motor is essential. One instance in Reedley: Two tractors were working under the same conditions; the motor of one was badly cut out and almost ruined after 500 hours service, the other showed no signs of wear whatever after 300 hours work. They were both equipped with air cleaners—one did not keep out the dirt and one did.

With clean air and proper lubrication the wear on a good motor is very small; it is not work that wears out an engine but sand and dirt from the atmosphere.

Nearly all tractors come equipped with an air cleaner, there being several makes on the market. The purchaser of the tractor should take every care to procure the best machine on the market. The life of the motor is insured by the purity of the air supplied through the carburetor.

CAPACITY AND POWER REQUIREMENTS OF SILAGE CUTTERS

Some technical capacity and power tests on four standard motors of silage cutters now on the market were recently made by the engineering department at the Wisconsin college of agriculture at Madison. The first brief summary is as follows:

Type.	Cut Length.	H. P. Hours Per Ton.	Tons an Hour.	Average Power Needed.
Cyl. abt.....	½ in.	1.27	14.28	18.14
Fly wheel..	½ in.	2.14	15.01	32.12
Fly wheel..	⅜ in.	2.02	9.03	18.24
Fly wheel..	⅜ in.	2.23	12.36	27.56

The first one made 1,800 cuts a minute and the throat size was 15 by 4½ inches. The net current used in cutting was 26.2 kilowatts, and equivalent to 35.2 horsepower hours with a total tonnage of 27.7 tons.

The second one made 3,200 cuts a minute, and the throat size was 16 by 6½ inches. The net current used was 52.8 kilowatts. This was equivalent to 70.8 horsepower hours with a total tonnage of 33.14 tons.

The third one made 2,250 cuts a minute, and the throat size was 13 by 3¾ inches. The net current used in cutting was 14.07 kilowatts. It was equivalent to 18.8 horsepower hours and the total tonnage was 93.3 tons.

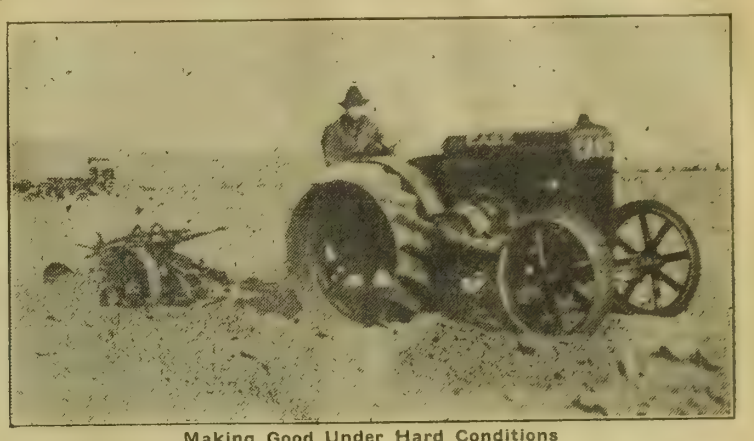
The fourth one made 2,350 cuts a minute and the throat size was 17 by 9½ inches. The net current consumed in cutting was 23.9 kilowatts. This was equivalent to 32.1 horsepower hours and the total tonnage was 14.4 tons.

OUR MOTORIZED FARMS

If the pioneer farmer of America, who broke the virgin land behind the slow moving ox and who laboriously hauled his produce to distant markets, could return now, he would stand speechless at what he saw. Instead of the ox and the horse, which once drew his plow and wagon, he would find nearly two and a quarter millions of gasoline tractors, auto trucks, and motor cars doing the work of the farms, and serving the nation with food.

Were the ghostly spirit of the past to inquire further it would find an average of 332 of these strange mechanisms on each 1,000 farms throughout the country. In eight states he would find that more than half of all the farmers owned a motor driven vehicle of some sort. And not only this, the spectral pioneer would be completely dumfounded by the private electric plants, electric dairies and other labor saving mechanisms of which he never dreamed.

Census reports often are dry reading. But the preliminary report on farms of the 1920 census, just issued, is susceptible of being made into a romantic story of agricultural progress. Science has not been unmindful of the farmer in her march, and he has nothing to complain of in the checking up of her gifts. — Cincinnati Times-Star.



Making Good Under Hard Conditions

The new 10-18 Case Tractor pulling three 10 inch Grand Detour plows in hard, dry ground with loose top soil.

POTATO RAISERS USE TRACTORS

Power farming has shown itself to be peculiarly adaptable in the potato growing regions of the country. Of course the processes of soil preparation are all handled exceptionally well by tractor power. The planting too can be done by machines drawn by tractors. A number of large growers are using motor cultivators for all the tillage work, and in the harvesting the tractor pulled potato digger of today is the logical evolution of the old back breaking spading fork.

In 1866 by the methods then in use it required 108 hours of a man's time to produce one acre of potatoes with a yield of 220 bushels. Using modern machinery the time required to do the same amount of work has been reduced to 38 hours, a saving of approximately 65 per cent in time.

At present prices and using the old method, the cost of producing an acre of potatoes was $13.18. Up to date equipment has brought this cost down to $5.95, a saving of approximately 54 per cent in actual cash.

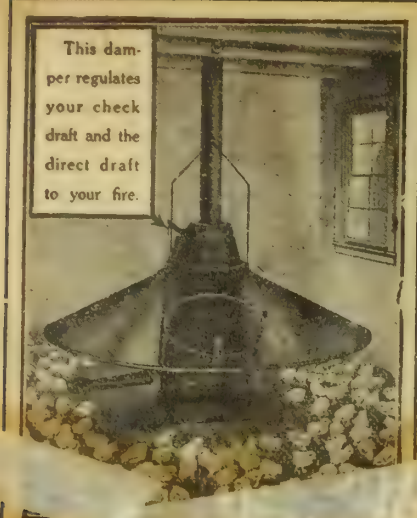
The addition of anti-friction roller bearings, encased in dust proof enclosures, represents a recent and important step in the perfection of the potato digger and it has been proven through actual field tests that a machine so equipped requires much less power and is far more dependable than one with plain bearings.

China's interest is not so much in disarmament as it is against dismemberment.—Columbia Record.

And in the present Christmas let us give
All help, from care the suffering to release;
All zeal, to share our happiness and peace,
For life is long enough for love to live
And short enough for bitterness to cease.

All glory be to God on high,
And to the earth be peace;
Good-will henceforth from heaven to men
Begin, and never cease.

The message of "good will to men,"
Divinely clean and bright,
Shines from the hills of Bethlehem
With everlasting light.



Brooder Stoves

burn coal, coke, wood, or briquets. The only safe and reliable method of brooding chicks. Queen stove has patent draft that controls heat perfectly. Write for catalogue, also ask for general catalogue of full line poultry supplies.

Intensive Poultry Culture--The Tupper System

By M. E. Bemis

FOR a long time to come the big commercial poultry plants of this country will continue to be run on much the same general lines as the other successful plants of this period. There will always be some that for one reason or another cannot go into poultry on the more or less extensive plan of general commercial poultry farms. This class of poultry keepers, or would-be poultry keepers, constitutes a large number of people, and their total production, while not approaching in volume the total [illegible] farm poultry [illegible] ercial [illegible] are that [illegible] rth consideration.

Intensive systems of poultry culture appeal most to those who are long on time and short on available land. The intensive systems should not for a moment considered by those who do not expect to devote a certain amount of time each day at regular hours to the poultry, and to the exclusion of everything else. A proportionately greater amount of time for the number of fowls must be taken or the intensive plant fails at the start. To women who must do most or all of the work in connection with poultry; to the semi-invalid, the crippled or the aged, intensive poultry keeping may be made to pay big returns upon the investment and net good wages and a good profit in addition. To some extent the intensive systems apply well to the backyard fancier, but it has been my observation that as a rule the backyard poultryman must make his poultry fit into spaces not otherwise taken up with garage, garden, walks and shrubbery, and perforce he must make his own system or adapt some of the others to his own peculiar needs.

A fault of many of the systems, so far as this southwestern country is concerned, is that they do not seem to be well adapted to hot climates. Some of them involve too much work, in other words they are too intensive, and some quite possibly are not practical under any conditions or for any climate.

I have seen hens kept under a great many conditions in a geat variety of climates. We have here in Arizona some commercial flocks, handled in such a manner that it would be hard to imagine that much improvement could be made. We have many farm flocks that are well cared for and are returning profits that indicate there is little room for improvement, and we have many backyard breeders and poultry keepers that are doing well, but in my opinion it has been left for Carl Tupper and his wife to work out a plan that will enable one to keep the greatest possible number of chickens to the acre and return a maximum profit for a hot climate.

This system is best adapted for a combination fruit orchard and poultry farm but might be made adaptable where there is no shade by the growing of thick rows of castor beans. The plan calls for a series of yards 30 feet long and 12 feet wide. On the Tupper farm these yards extend along the south end of an olive orchard and run east and west. This makes the fronts of the houses, which will be described presently, open to the north, a possible objection for most locations, but on this farm, protected as it is in this grove, the north front is less of a disadvantage than an advantage.

Cross fences divide the long runs into 30 foot sections or separate yards 12 feet wide. Set into each division fence is a self-feeding hopper with openings on each side and a capacity sufficient for a week's supply of mash and rolled barley. The trough of this hopper is set up from the ground about ten inches, and underneath are set two crocks, one for water and one for skim milk or Lactein. These crocks as well as the hoppers serve two pens. The hoppers are covered with a roof that extends out far enough to be a protection against occasional rains. Shell and grit boxes are provided for each pen, also nests built something like the hoppers, that is, set off the ground a few inches and covered.

The house is simple and inexpensive but serves its purpose as a roosting house and to some extent for shade. This house is built of 2 by 2 scantling for the frame work. The front is 6½ feet high from the ground to the roof, and the rear 5 feet. The roof is iron roofing 6 feet long, which allows for an extension of about six inches over front and rear and is laid so as to extend out over the sides a few inches.

Economical Poultry House
House on Tupper poultry farm shows method of setting roosts at right angle to front.

The floor or droppings board is built on a framework which is a part of framework of the house. It is 1½ feet from the ground. The floor is made of ½ inch lumber, laid tight. This floor, as before stated, serves the double purpose of droppings board and shade. Roosts are 1 by 2 laid flat on a framework which is suspended by wires and held rigid. This requires two wires at each corner, one on the top extending to the corner post about 6 inches above the framework of the roost, and the other below also extending back to the corner. The roosts are fastened to the framework at right angles to the front of the house, or in other words the ends of the roosts are towards the front. The roosts are suspended about 6 to 8 inches above the floor.

The sides and back of this house are burlap, and in summer a part of this is removed. The houses are 6 feet wide, and six roosts 4 feet long, the depth of the house, give a roosting capacity of 24 feet. As 30 birds are kept in each pen this gives about 9½ inches for each bird. I am aware that many would consider this too close crowding, but it seems to work satisfactorily.

An acre of ground in the form of a rectangle 10 rods by 16 rods would give, allowing for 4 foot alleys between runs, about 100 pens, or a capacity of 3,000 birds to the acre. Cost of fencing would be the biggest single equipment item, as the houses are comparatively inexpensive.

The yards are covered with gravel, and no litter except the heads of milo or hegari is permitted. Yards are cleaned frequently so that there is no accumulation of filth of any kind. The droppings boards are cleaned daily. These birds keep busy; they move about in the yards, jump up on the feed hopper, then down again, and seem to get all the exercise that is needed and at the same time do not use up too much energy in running over

acres of ground. Egg production has run high. The production during the hottest weather runs as high as 80 to 100 per cent. The summer heat is a trying period with many flocks. The summer grain feed is wheat and dry mash in the hoppers is fed all the year. This mash is composed of one sack bran, 20 pounds cornmeal, 12 pounds shorts, 4 pounds charcoal and 16 pounds beef scrap. Green feed is cut and fed daily, sometimes alfalfa, sometimes grain or lettuce—whatever is accessible.

There are advantages that the intensive systems have over other methods of handling poultry, chief of which is the closer supervision possible. Tupper calls attention to the simplicity of the culling. At night he can go to any house and in a few minutes go over every bird. They are all in easy reach, no shifting around and getting mixed up. In the yards during the day if one appears to be sick it is easy to pick her up and get her away. At all times the fowls have more of the individual attention that makes for success in poultry keeping.

Pen production can be closely watched, and if the production of one pen fails the reason can be ascertained more readily than when the birds are all in one flock. The best birds can be more readily selected, and in this way breeding stock of the best more easily maintained.

For breeding yards 12 birds only are allowed in one yard or pen. These are mated to a vigorous male, only one being allowed for each yard.

The health and vigor of the birds is excellent, certainly fully the equal of birds in larger flocks with wider range. The system is entirely practical under conditions that make it necessary to economize on space. It is quite possible that enough better results may be had to justify the use of such a system on a commercial scale. That could only be determined by careful experimenting. It has taken some time for the Tuppers to work out their system. Each step has been thought out and then tried out until they feel that it is as near perfect as it can be made. This coming year they will increase from 300 laying hens to 1,000, gradually extending the yards to cover the five acre olive grove.

Conducted by Jean A. Koethen

Chickenpox

Will you please tell me what to do to prevent and cure chickenpox and canker? My hens are continually becoming infected although every precaution is taken. My hens are removed from the pens as soon as they show any sign of being sick, houses are kept clean, water jars disinfected daily. Have been feeding semi-solid buttermilk in a wet mash daily and am inclined to think this may be responsible for the canker.—J. A. B., El Monte.

What you call canker is one of the symptoms of severe cases of chickenpox and is not due to the wet mash nor to the buttermilk. Please note reply to Selma subscriber. As the disease is progressing slowly in your flock you may be able to check it by vaccination. Write Poultry Division, College of Agriculture, Berkeley or Davis, California, for particulars. While you are waiting for a reply try sulphur in the mash as recommended by Dr. Sanborn, and lighten up the ration, i. e., add bran to the laying mash, give more greens, if you are not giving all the hens will consume, and less hard grain. The prevalence of chickenpox this fall may be due, as some surmise, to the warmth and dryness of the season which demands lighter feeding than is customary.

Sore Eyes

My White Leghorn hens are troubled with a sore eye, different from anything I ever saw, and I have kept hens all my life. It is not roup. One eye becomes greatly inflamed, lids swell, eye closes. One hen went blind in affected eye and then recovered. They are not sick, yet do not feel well. I bathe the eyes with boric acid containing a few drops of peroxide, but without effect. Houses are clean, ration balanced. Please give me what help you can and ask your readers to help me.—Subscriber, Ontario.

I believe you will find, if you make a careful examination, that this eye trouble is caused by some bit of dry weed or sticker that has found its way into the passage between eye and nostril. You may find it under the lid if you look for it. Such cases are not uncommon at this season. If the sticker is under the lid it will be easy to remove it. If it is in the nasal passage you can only find it by inserting the tip of a small feather which has been dipped in boric acid. Insert the feather very gently at the inner corner of the eye and give it a twist before removing. A poultryman of many years' experience says he has followed this plan for years in treating such cases and always with success. If readers of this column have further suggestions to offer we shall be very glad to hear them.

Ticks

My chicken houses are infested with ticks. Is there any way of getting rid of them without tearing down the houses?—Subscriber, Fresno.

A man who had kept chickens in Arizona, where ticks are a great pes told me recently that crude oil b been found the best remedy there. course the lumber must be so with it inside and out. Use a and see that every crack is After you have gone over your with oil you may have to fo p with a coat of crude carbolic id diluted 50-50 with kerosene. The two together ought to fix the pests, but you may have to repeat the dose. It just depends on how badly the houses are infested.

Chickenpox

My chickens have sore eyes and sore warts at the side of the nostril. I understand this is chickenpox. I doped them with oil disinfectant, also touched the sores with iodine, but to no purpose. When they get this disease they die. Is there any satisfactory remedy, or is it best to chop their heads off at the start?—Subscriber, Selma.

I am sorry to say no perfectly satisfactory remedy has been found. You might write the poultry division of the state college of agriculture at Davis in regard to vaccinating. They furnish the vaccine and give full instructions for using it, but they do not claim that it always secures immunity, nor that what immunity it secures is lasting. If your chickens all have the disease it is probably too late to vaccinate, but you might try Dr. Sanborn's remedy, which is a pound of sulphur mixed in 50 pounds of dry mash. He claims that in Florida the use of sulphur always mitigates the disease in poultry which is already affected and prevents it in birds that have not developed the disease. Chickenpox has until recently been considered an infectious germ disease, but some poultrymen who have had a good deal of experience with it now believe it results from heavy feeding in warm weather and must be prevented by correction of the diet. If this theory is correct sulphur ought to be of some use in treating the disease.

More Chickenpox

Some of my hens have blistery sores on their heads and watery or sticky eyes. They recover in ten days, but the disease seems very contagious.—Subscriber, Lodi.

Please note reply to Selma subscriber above. Your chickens undoubtedly have chickenpox.

Head Lice

What will kill head lice on hens?—Subscriber, Lodi.

Any kind of grease rubbed on two or three times will kill them. Carbolated vaseline is good, and plain lard is just as good.

Paralysis

What causes chickens to become paralyzed? I have lost several in that way.—Subscriber, Lodi.

Paralysis is almost always due to intestinal disturbance, sometimes to worms, sometimes to indigestion, sometimes to the eating of spoiled meat or other poisonous food. A dose of physic, castor oil or Epsom salts, is always the first treatment, and a light diet with plenty of greens should follow it.

CALIFORNIA FARM BUREAU EGG LAYING CONTEST

Alex. Stewart's entry is high pen again for November, the second month of the 1921-1922 contest, with a production of 219 2-3 eggs. J. J. Shore's pen takes second ribbon with a record of 210 1-3 eggs and H. H. Corbett is again in third position with a monthly production of 199 for his ten layers. L. A. Thornwill's pen won the ribbon for highest hen for November with 27 eggs to her credit although three others also laid 27 each, as the contest rules state that in case of a tie, the hen with highest record for the previous month gets the award. The highe for November are: 27 eggs Alex. Stewart, Hanson W. H sha W

ID ON THE EGG MAR

spectacular drop in the lo market the first week in Decem s not traceable to any legitimate e. There was no sudden increase the supply, in fact, the San Fran co receipts for the week were the nallest of the entire year. Nor was here any falling off in the demand, except as it was disturbed by the natural inclination of the retailer to hold off when the market is dropping.

When a drop in the market results naturally from an excess of supply over demand, practically every wholesaler has a surplus and they all try to sell their surplus on the Exchange in order to get rid of it. Under this condition nobody is anxious to buy, so the price drops to the point where buyers are willing to take on the surplus.

Was this the case the past week? Emphatically, no! There were few sellers of extras and comparatively few were offered on the Exchange.

What, then, was the cause of the drop? It had all the earmarks of a bare-faced raid, engineered with a double purpose—to get eggs at low prices for shipment in time for the eastern Christmas demand, and to scare the holders of the remaining storage eggs into selling them cheap to the raiders. Then if the raid succeeded, the price could be put up with resulting profit to the new owners.

Early in the week the word was passed "on the street" that the market was going down to 50 cents (it was then 67½). It was even stated how much the drop would be from day to day. The buyers, being thus "tipped off," of course held back on the Exchange and waited till the two or three sellers offered the market down toward the expected point. Under these circumstances, it did not take many sales to put the price down, because the buyers, being aware of the program, only bought enough to barely last them from day to day.

As usual in such instances, the real raiders did not actively appear. They operated through one or two other men who carried out the program. It was all done exactly as arranged, except that when the price was put down to 50 cents on Friday it did not stick there because, on account of the demand for week-end supplies (there being no Exchange session on Saturdays), the situation rather got away from the program, and after touching 50 cents this demand brought the price up again to 52.

Pullets naturally followed extras down the incline until Friday, when the week-end demand forced them up also.

Knowing what was afoot, we did not sell any extras on the Exchange all week, preferring to ship our surplus East, where the market, though weaker, still shows a large margin of profit over the local price.

Our association average prices returned to the members for the past week's eggs of course show a heavy loss as compared with the quotations. Our actual sales for the week were above the average of the net quotations, but the heavy loss on the inventory carried over from one week to another brought down our average.

The moral of this raid on the market scarcely needs to be pointed out, but there is one thing we do want to say about it, which is, that as long as the Dairy Exchange quotations continue to be made by the last sale of the day of the last bid or offer, just so of thing be p ds, the prese ays into speculators a est of cer Ma General of Ce California.

THE POMONA

Duplex Plunger Deep Well Pumps

are solving the Pumping problems for many users during the period of low water levels. They will lift the water to the surface, and, if desired, deliver it to high elevations above ground and at lower power cost than any other system of Pumping water.

Tallow—No. 1 white and hard, 5 per lb.; No. 2, 4 per lb.; No. 3, dark and greasy, 1@3 per lb.

Wool—According to quality and condition, 6 per lb. and up.

POTATOES AND ONIONS

These are the actual prices obtained between 7 and 8 o'clock, December 20, by wholesalers in their sales to retailers, peddlers, hotels, restaurants, cafeterias, etc. Terms: Cash on walk. There may be slight fluctuations during the day's trading.

Potatoes: Movement slow, market weak. Lugs mostly 90@1.00. Stocktons: Burbanks, per cwt., best, special brands, 2.50@2.75; others, 2.25@2.50. Idahos: Russets, best, 2.25@2.50; Rurals, mostly 1.90@2.00; few, 2.50; bakers, 3.00. Locals: White Rose, 2.00@2.25. Sweet potatoes: Market firm. Locals: No. 1, best, 90@1.15 per lug; per cwt., No. 1, 2.75@2.90; No. 2, 1.50@1.75.

Onions: Demand moderate, market firm. Stocktons: Per cwt., White Globes, best, cold storage stock, mostly 6.75@7.25; poorer, 6.50; browns, best, 4.75@5.25; poorer, 4.25@4.50; per lug, Whites, best, 2.00@2.25; poorer, 1.85; Browns 1.50@1.60; poorer, 1.25. Spanish sweets, best, mostly 6.25@6.50 per cwt.

Garlic; Lb., 9@11.

VEGETABLES

These are the actual prices obtained between 7 and 8 o'clock, December 20, by wholesalers in their sales to retailers, peddlers, hotels, restaurants, cafeterias, etc. Terms: Cash on the walk.

Artichokes: Doz., 1.60@1.75.

Beans: Demand good, market strong. Per lb., string, 20@22; limas, 16@18.

Bunched vegetables: Per doz. bunches: Turnips, 50@60; beets and carrots, 65@75; radishes, 30@40; parsley, 20; spinach, 35@40.

Cabbage: Market steady. Per field crate, mostly 2.75@3.00; poorer, 2.25@2.50.

Cauliflower: Market steady. Best, mostly 2.75@3.00; poorer, 2.25@2.50.

Celery: Market firm. Local, per cr., mostly 3.25@3.50; few, 3.75; poorer, 3.25@3.50.

Cucumbers: San Diego: Market steady, mostly 2.00@2.50; poorer, 1.00@1.75; local hothouse, doz., 1.25@1.65.

Lettuce: Demand moderate, market firm. Locals: Field crates, best, 2.25@2.50; poorer, 1.50@2.00.

Parsnips: Lug, 85@90.

Oyster plant: 50 doz. bunches.

Peas: Market firm. Local, best, 16@18; poorer, 12@14.

Peppers: Locals: Bells, green, per lb., 12@14; chili, 10@12.

Rhubarb: Mostly 1.00@1.15.

Squash and pumpkins: Market steady, movement moderate. Banana, 1@1¼ lb.; Hubbard, mostly 1¼ lb.; cream squash, 2; Italian, lug, 1.50; pumpkins, 1@1½ lb.; Imperial Summer, 2.00 per 4 basket crate.

Sweet anise: 60 doz.

Tomatoes: Market firm on good stock. Locals: No. 1, per lug, mostly 2.50@3.00; poorer, 1.00@2.25.

FRESH FRUITS

Apples: Demand and movement moderate, market steady. Locals: Romes and King Davids, 4@6; few best Delicious, Yucaipa section, 6@8 lb. Watsonville: Fancy, 3½ and 4 tier, Bellefleurs, 1.60@1.75; poorer, 1.50; 4½ tier, 1.40@1.50; B grade, 4 tier, 1.40@1.50; loose, per lb., 3½@4. Idahos, Washingtons and Oregons: Jonathans, extra fancy medium to large sizes, 3.00@3.50; fancy, 2.85@3.00. Oregons: Spitzenburgs, medium to large, extra fancy, mostly 2.60@2.85; fancy, 2.50@2.65.

Avocados: 50 lb.

Cranberries: Market steady. Massachusetts: Late Howes, 25.00 bbl.; New Jersey, Late Howes, 27.00@28.00 bbl.

Dates: 25@27.

Grapes: Demand good, market steady. Per lb., Malagas, 12; Red Emperors, 10@11.

Melons: Demand light, 2@2½ lb. for good stock.

Olives: Ripe, lb., 4@6.

Pears: Anjous, per lb., 8@10; Bartletts, 4@5; few 6.

Persimmons: Lb., 10@15.

CITRUS FRUITS

Grapefruit: Market steady. Californias, northern: Packed, box, 3.00@3.50; small, 2.50; Imperial Valley, 5.00@5.25. Arizonas: Seedless, 4.00@5.00, according to size and quality.

Lemons: Demand and movement slow, market weak. Locals: Special pack, mostly 4.00; market pack, 2.50@2.75; loose boxes, 1.50@2.00; poorer, 1.00.

Oranges: Demand moderate, market steady. Navels, special brands, 216s to 126s, fancy, 5.25@5.75; choice, 4.00@5.00; orchard run, 4.00@4.25. Valencias, market pack, 3.00@4.50, according to size and quality. All varieties culls, field boxes, 2.00@2.50; poorer, 1.50. Tangerines: Demand and movement good; best, 10@11; poorer, 9.

HONEY

The general situation shows little change over that prevailing two weeks ago. Stocks continue to decrease and are much lighter than were those at the corresponding period last year. Demand is reported as light. Due to light supplies, the market, although quiet, has a healthy tone. Alfalfa honey is in heavier supply than white honey. Quotations per pound in carlots or less than carlot quantities, f. o. b. California points: White orange blossom, nominally 12@12½; white sage, 11@12; light amber sage, 8½; light amber alfalfa, 6½@6¾. Growers are said to be asking 10@13 per pound for white orange blossom and 6½@7 for light amber alfalfa. Beeswax is in fair local demand at present at 20@25, mostly 22 per lb. to the beekeepers by bee supply houses for use in making next season's foundations. Demand in the East is lacking, as imported wax offers too great competition.

GRAIN AND FEEDS

Grain Exch. price bid Dec. 20:
Barley: 100 ton lots, Dec. del., 1.32.
Milo: 100 ton lots, Feb. del., 1.35.

HAY

Alfalfa Growers of California report:

Continued good demand with lighter offerings kept market strong in all parts of the state. Prices show a small advance. The demand centers on the better qualities.

There were 1,490 tons of grain and alfalfa hay received on the Los Angeles tracks the week ending December 17, with 310 tons held over.

Prevailing prices last week, delivered in the vicinity of Los Angeles:

No. 1 dairy alfalfa	23.50
Standard	18.50

Quotations by Nichols-Loomis Company. Following are prices to growers f. o. b. Los Angeles in carload lots; handling and commission must be added to obtain retail prices on new hay:

Tame Oats	22.00@28.00
Barley	18.00@24.00
Alfalfa, Rabbit	24.00@28.00
Alfalfa, No. 1 Dairy	20.00@22.00
Standard	16.00@18.00
Straw	12.00

HAY AND FEED

California Alfalfa Growers report:

Prevailing prices last week, f. o. b. San Francisco:

No. 1 Dairy Alfalfa	16.00
Standard	15.00

A. W. Scott Co. says:

Receipts past week, 776 tons as compared with 522 previous week. Market has been steady, trade fairly active. Low grades have been doing better. Local trade quiet but export and coastwise heavier. Interior trading more active. Continued cold, dry weather has forced feeding in almost all sections and the demand has greatly increased chiefly for stock and dairy hay of all kinds. Alfalfa is most active.
red milo, 1.42½@1.45.

We quote today wholesale prices in carload lots as appear from dealers' transfers upon the markets in San Francisco (for prices to consumers, charges of switching, cartage, commission and handling expenses must be added, according to conditions).

Wheat hay No. 1	17.00@19.00
Wheat hay, fair grade	14.00@17.00
Tame oat hay	15.00@18.00
Wild oat hay	11.00@13.00
Alfalfa hay	13.00@16.00
Stock hay	9.00@12.00
Straw	10.00@12.00
Rolled Barley	29.00@30.00
Ground Barley	31.00@33.00
Oats, Rolled Feed	34.00@36.00
Bran and Millrun	25.00@28.00
Middlings	41.00@44.00

Corn: California yellow, 1.45@1.50; eastern yellow No. 2, 1.37@1.40; No. 3, 1.36@1.38; No. 3 kaffir, in bulk, 1.43@1.45; white Egyptian, 1.72½@1.77½; California red milo, 1.42½@1.47½.

Citrus Markets

Los Angeles, December 21, 1921.

The holiday trade was very satisfactorily supplied with Navels and they have found a fair demand generally at very reasonable prices. Central California shipping points are planning for cleaning up on Navels which will reach the market soon after the holidays and meet the demand until the larger portion of the Southern California crop is ready for shipping about the middle of January.

Foreign lemons are arriving in very limited quantity but the demand is light and price not the best.

Shipments

Shipments of citrus fruits to date since November 1, 1921, Southern California: Oranges, 943 cars; lemons, 689; total, 1,632. To same date last season: Oranges, 1,038; lemons, 595; total, 1,633. From Central California to date this season: Oranges, 3,647; lemons, 20; total, 3,667. To same date last season: Oranges, 3,283; lemons, 27; total, 3,310. From Northern Califor-

nia to date this season: Oranges, 322; lemons, 5; total, 327. To same date last season: Oranges, 271; lemons, 2; total, 273.

AUSTRALIAN SALTBUSH

In United States department of agriculture bulletin No. 617, R. McKee deals in detail with "The Australian Saltbush (Atriplex semibaccata) in the United States." A summary of the chief points follows:

The Australian saltbush (Atriplex semibaccata) was introduced into the United States some 25 years ago and was distributed throughout the arid and semi-arid regions. In practically all cases the plantations resulted in failure, and only along the coast, in the San Joaquin and Imperial Valleys, and in the Salt River, Yuma and Santa Cruz Valleys of Arizona has it become well established. The plant is a perennial and prostrate, forming a dense mass from 6 to 12 inches thick. The minimum temperature of the regions in which it is naturalized is 19 degrees Fahrenheit; the mean annual rainfall in regions where it is possible to cultivate without irrigation ranges from 9 to 16 inches. While the Australian saltbush can grow on practically all types of soil it is found in but few regions where the soil does not contain an appreciable amount of alkali. It is quite drouth resistant, but apparently not to the extent of some other species of Atriplex and other desert plants.

The chemical composition of the leaves and stems of A. semibaccata and of the hay therefrom shows respectively: Water, 78.03 and 7.05 per cent; ash, 4.58 and 19.37 per cent; crude protein, 2.75 and 11.64 per cent; crude fibre, 3.75 and 15.83 per cent; nitrogen free extract, 10.41 and 44.05 per cent; crude fat, 48 and 2.01 per cent. The stems and leaves have therefore an unusually high content of salt (especially sodium chloride) and comparatively high percentages of protein, nitrogen free extract, and crude fat.

In regions which offer favorable conditions, semibaccata is quite aggressive, and this adds to its value as a range plant. On account of its high salt content it is not as palatable as most ordinary forage crops, but it is eaten readily by sheep, goats, cattle and horses when other feeds are scarce. To be of the greatest value it must be supplemented with other feeds.

The greatest value of this plant is to supply succulent feed in late summer and to furnish a reserve supply. It can be used as a soiling crop, but has little value as hay. Seed is produced freely, but harvesting is expensive. For range purposes A. semibaccata should be sown in the autumn, scattering the seeds broadcast in favorable locations and leaving it to take care of itself. In sowing with a view to cultivation, the best time is in the spring and care should be taken to cover the seed only enough to ensure moisture conditions favorable to germination.

A NATIONAL PROBLEM

Victor Murdock of the federal trade commission, in speaking of the agricultural industry of the country, recently made the following remarks:

All men are taking more thought of the farm problem.

The basic industry is agriculture. Bread and butter is the foundation of material thrift, and it has also to do with the spirit.

Six startling features of the farm problem have risen to inconvenience those with ready remedies.

First: Tenantry, which is not best for agricultural thrift, is increasing by leaps and bounds.

Second: In the richer regions farms are increasing in average size.

Third: Great areas of tillable land in tillable sections are not tilled.

Fourth: There is a measurable exhaustion of cheap available land in new states.

Fifth: The cities are gaining heavily in population at the expense of the country.

Sixth: The annual food reserves of the nation are gradually diminishing despite increased machine production.

One of the aids offered in the solution of the problem will not solve it. This is the essay periodically written by the city dweller urging the delights and advantages of the farm on his fellow citizens.

Another aid that will not solve it is the occasional easy preachment of the city economist to the farmer that the farmer has all the best of it.

Still another aid that will prove equally impotent is the city theory of a multiplication of creature comforts and social delectations in rural districts.

The nation is not coming to a solution of the problem in any such easy fashion. The nation will not come to any solution until it radically reforms its concept of the farm and the farmer.

Here are some things which the nation, as a whole, could helpfully ponder:

One: Farms are not merely fenced fields which respond to cultivation. Farming is a profession which must be learned.

Two: Farms do not yield through the device of applying labor cheerfully to fertile soil. There is another essential ingredient—working capital. For farming is not only a profession; it is also a business.

Three: Farms do not show profits by adding together at the end of the season the sales realizations of their products. There are material and labor costs, insurance, taxes, hazard, and depreciation in the profit computation. For farming is not only a profession and a business; it is also the most intricate accountancy.

PURPLE VETCH

Vicia atropurpurea, or the purple vetch, is an annual; it was brought into the United States from Naples by the office of foreign seed and plant introduction in 1899, and all the introductions since then have been of the same variety. The crop has been tested most extensively in the Pacific Coast States, where it has given very favorable results. In California it has proved one of the best crops, if not the best crop for green manure. In West Oregon, and West Washington, it can be grown with success for seed, and at the present time there is a limited acreage under purple vetch. It requires similar conditions to those needed by the common vetch (Vicia sativa) and the hairy vetch (Vicia villosa), but is a little resistant to cold. Under average conditions, however, the purple vetch will stand a temperature of about nine degrees Fahrenheit; where the temperature does not fall below this, it can be sown in the autumn; where the cold is greater, it is advisable to sow in spring. It is well to inoculate the soil when the crop is sown for the first time. The average seed yield is 10 to 12 bushels per acre. When grown for green manuring, seed or hay purposes, purple vetch should be seeded at the rate of 60 to 80 pounds per acre. It is very nourishing and affords good pasturage for all kinds of stock, as well as making excellent hay. The only insect that has attacked Vicia atropurpurea in the United States is an aphis which does serious damage to the field pea and common vetch.

POTATOES MENACED BY MOSAIC

A survey of the Western states conducted during the past summer by pathologists of the United States department of agriculture shows that unless adequate measures for the elimination of the mosaic disease of potatoes are taken immediately the work of potato seed improvement in the West will soon become extremely difficult, if at all possible. Being of an infectious nature, the disease is spread in the field throughout the summer by means of insects which carry it from diseased to healthy plants, and is also transmitted with the seed tubers from one generation to another.

There is no evidence that a plant once infected can recover and produce a healthy progeny at any time. On the contrary, the infected plants ordinarily tend to a very rapid deterioration, and under certain environmental conditions practicaly cease to produce tubers in the third or fourth generation. If only a partial weeding out of the worst cases is practiced, the situation may be somewhat improved, though not in all cases and by no means permanently. The mild and the medium stages of the disease left in the stock serve as perpetual sources of infection, and eventually the entire strain becomes diseased and is apt to "run out" completely.

It has been repeatedly demonstrated in the East that the average reduction of yield due to mosaic is about 30 per cent.

CUTTING FIREWOOD

A day's work with a buzz saw or drag saw will yield as much firewood as could be cut in many hard days' energetic work by hand and will effect a saving of labor or coal, or perhaps both, that is well worth considering, especially if there be timber available that is fit for fuel and not for lumber.

A great many farmers already have tractors or gasoline engines, and wood-sawing machines are comparatively inexpensive. One outfit can do the work for several families and may be bought in partnership or operated for hire.

The saw blade should be of ample size to cut through at one operation the largest piece of wood commonly handled. Blades from 24 to 30 inches in diameter are the most popular. A speed of 1200 revolutions for a 30 inch or 1500 for a 24 inch blade is recommended. A flywheel mounted on the saw mandrel will help to preserve momentum when the saw is going though the wood.

An engine of six to eight horsepower is sufficient for the heaviest wood, and one of four horsepower will suffice if only small poles and branches are to be cut. Garden tractors can be used very handily in this work.

BARLEY VARIETY TESTS IN SOLANO COUNTY

County Agent J. W. Mills of Solano County reports the results of a variety test with barley on the C. B. Kidwell ranch near Putah Creek, Solano County, last season as follows: Four Thousand, 16.6 sacks per acre, 95 pounds per sack; common, 17.5 sacks per acre, 94 pounds per sack; Tennessee Winter, 17 sacks per acre, 95 pounds per sack; Mariout, 23 sacks per acre, 103 pounds per sack.

In this case Mariout exceeded common in yield by five and one-half sacks per acre and weighed nine pounds heavier per sack. The grains were planted with a grain drill on February 28 and harvested July 1, 1921. Each plat was one-half acre in area.

ALIGNING THE TRACTOR.

Prof. John S. Glass of the Iowa state college offers some simple but valuable suggestions for setting the tractor for belt jobs.

Four operations are necessary to get the belt outfit set and ready for work. First, set the machine in convenient position so that the operators will not have to work in the dirt. Next, uncouple the tractor from the machine and drive forward away from it several feet. Then quickly cramp the steering gear to the right and proceed until the tractor has straightened out at right angles to its former position. Stop, reverse the drive, cramp the wheels to the left and back up until facing the machine again. This will bring the tractor into very close alignment. Further aligning may be done by backing away from the machine and then driving toward it, sighting along the edge of the pulleys.

Prof. Glass does not advise the use of a belt which makes the distance between pulleys less than 30 feet. A short belt is difficult to keep in good adjustment.

GARDEN TRACTORS

"The advantage of garden tractor work comes under the same head as all other tractor labor savers," says A. J. Piper, an extensive grower of onions and onion sets, writing in the Fruit Belt.

"You can do the same work and better work that would require several men to do by hand in the same length of time, which makes the labor saved the big item, and especially is this so at the present price of labor and with the difficulty of obtaining satisfactory labor at all for that kind of work."

THE NEW CASE

The new Case 10-18 tractor is being demonstrated at various places in California, always with increased interest. The new tractor has all the desirable features of the former models and includes an exhaust pipe to the left side and down, air cleaner, oil gauge, fenders, grousers, and is a sturdy piece of machinery throughout. One of the most desirable features connected with the ownership of a Case is the service afforded by the company's dealers and branches. They seek to give Case owners the very best of service and keep replacement parts close at hand at all times.

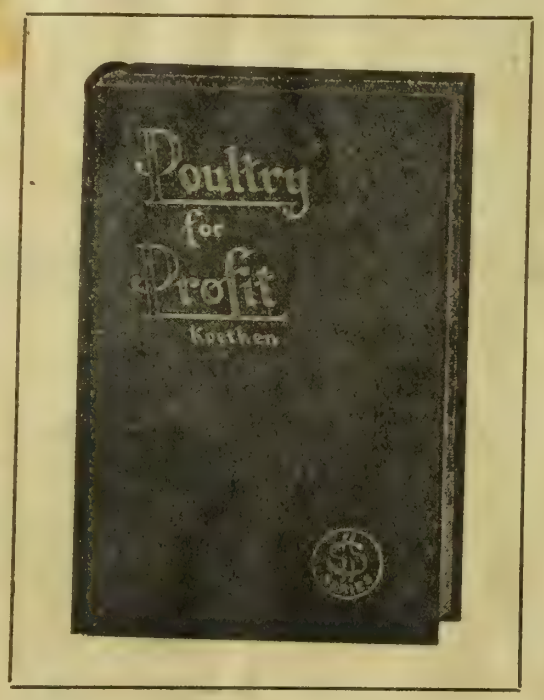
POULTRY Business

Profitable



Making use of information gathered from experienced poultry writers who have been guided by their practical experiences will always result in profit from poultry.

"Poultry for Profit"

By Jean A. Koethen

Gives more practical information on every branch of the Poultry Business and in a more concise and simple manner than any similar book published. With the knowledge gained by a study of this book, the necessity of practical experience is reduced to a minimum. By its guidance obstacles are overcome before it is too late.

Poultry for Profit is 5½x8 inches and contains 12 chapters, with over 225 pages of text and 18 pages of illustrations, printed on egg-shell book, binding full cloth vellum de luxe.

Some of the Valuable Information in this Complete Book

Making a Beginning
Marketing
Housing and Yarding
Sanitation and Hygiene
Incubation
Fixtures and Conveniences
Brooding
Diseases and Vices
Feeding
Ducks and Geese
Breeding
Turkeys

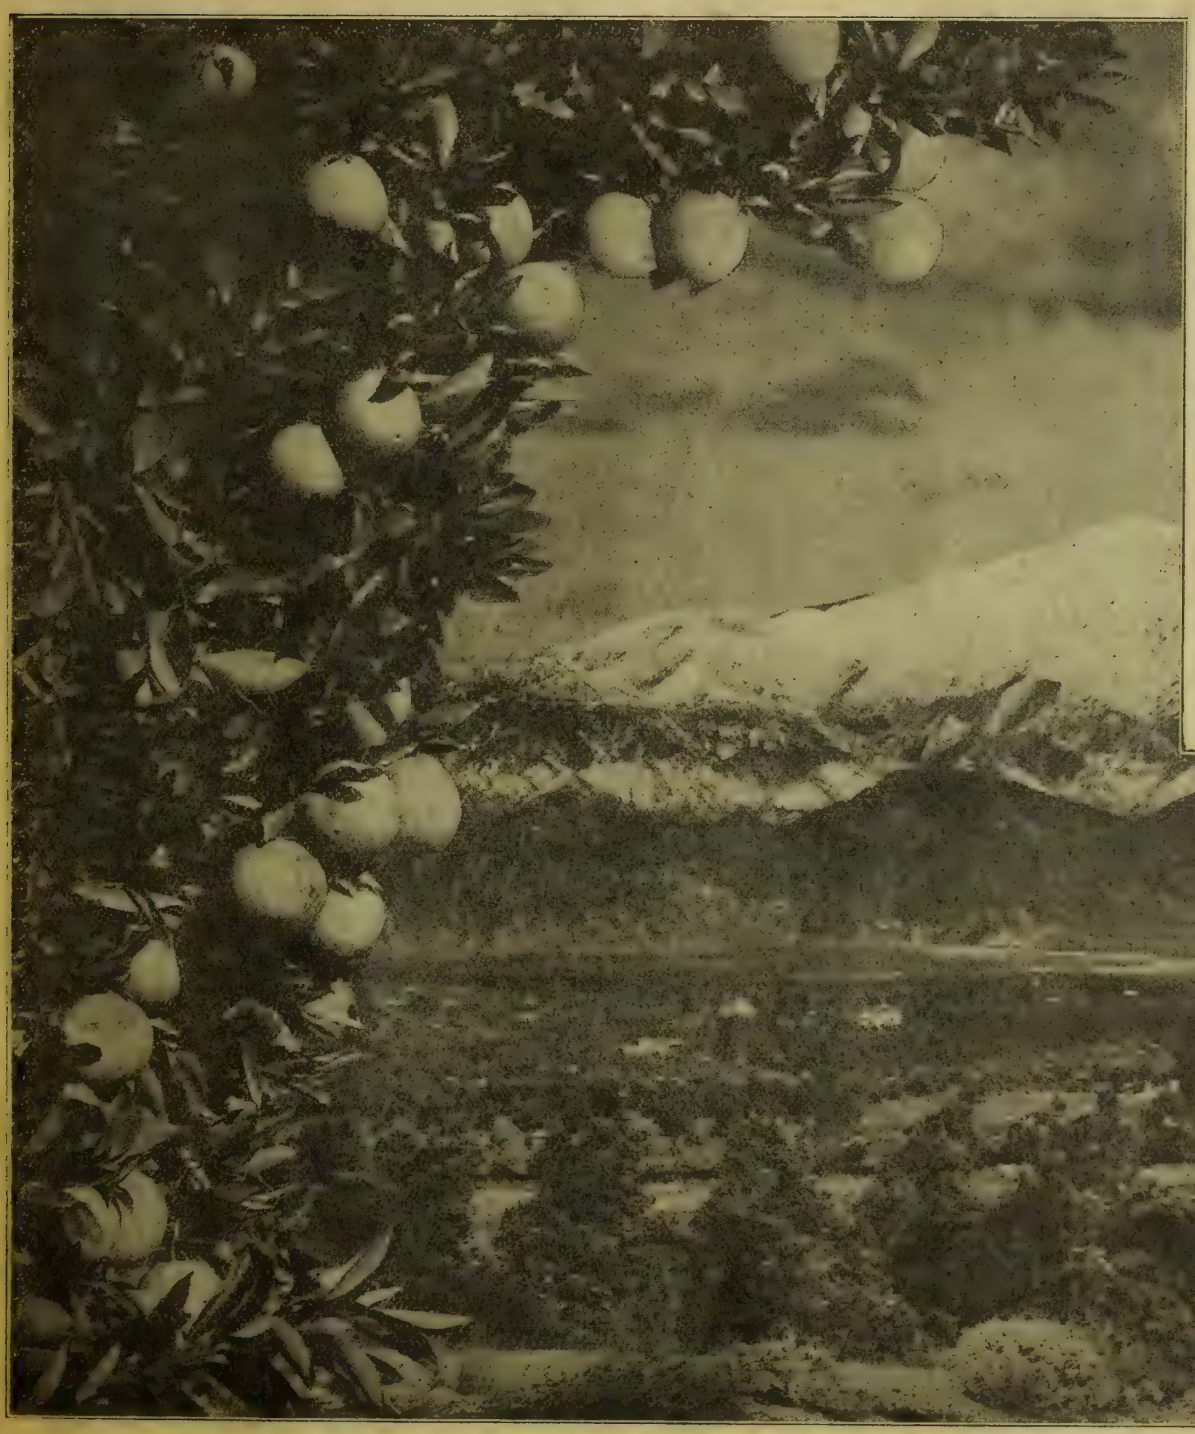
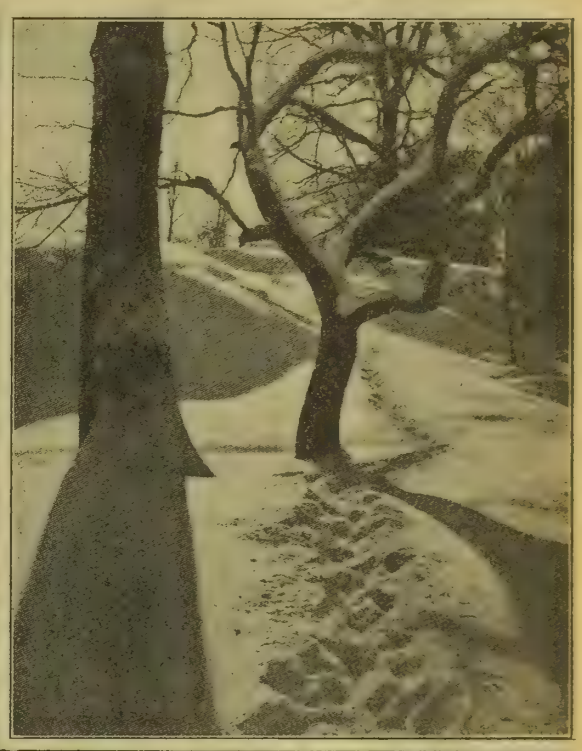
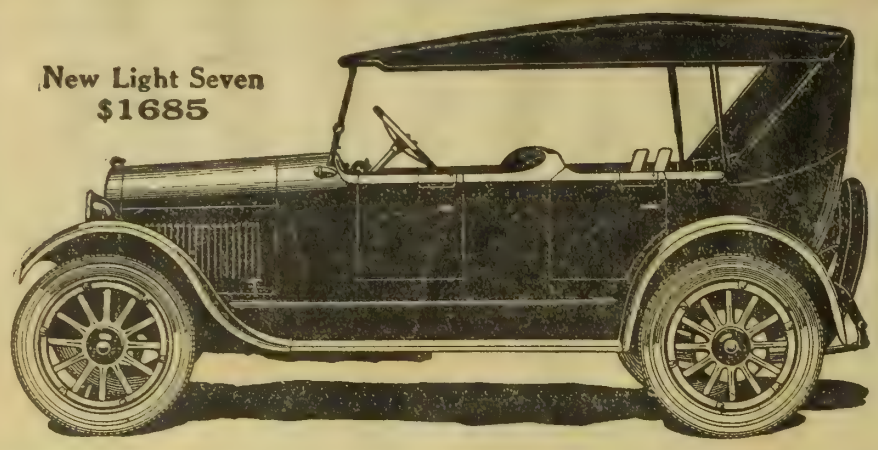
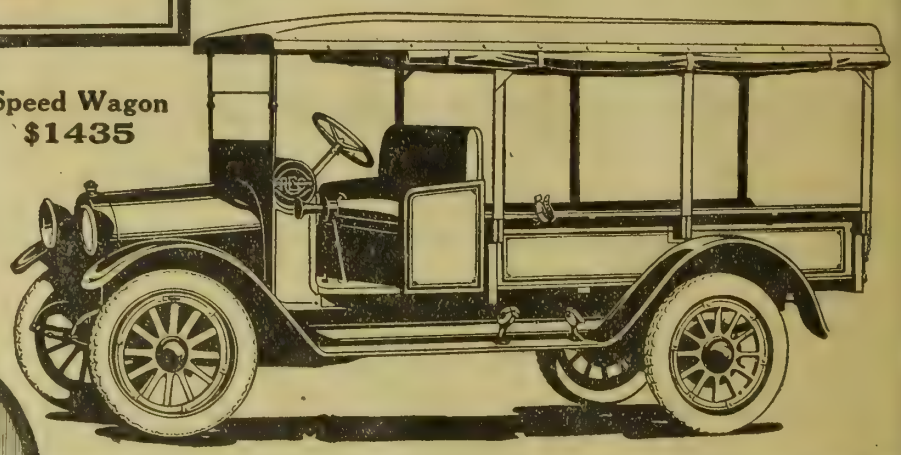
Own a Farm, Productive the Year Round--- Not Where Covered With Snow Half the Year







Prices are f. o. b. factory, plus Federal Tax



REO

These Two Reos Are Both Leaders

This New Light Seven Passenger Reo, recently announced, has found as enthusiastic a welcome on the farm, as was accorded that Mighty Speed Wagon.

And that is most gratifying to us, because we had in mind especially, our great clientele in "the country" when designing this latest Reo.

Families are larger as a rule—anyway the parties are—in the country than in the city.

So, although this New Light Seven has created a veritable sensation in the cities, its advantages are still more desirable to rural families.

From now on the Seven—and not the Five—will be the standard family car.

For, Reo engineers have proven that it is possible to build a car that will carry seven, and yet be as easy to handle on narrow roads or in "tight places" as was the Five.

And—here's the amazing point—at a price that is as surprising as is the quality and finish of the car.

Of that mighty Speed Wagon what can we add to what you already know?

It fits every business—meets every hauling and carrying need.

No matter what your work—no matter what the season or the roads or the loads—whether in everyday errands; carrying supplies or tools or implements to and from town; for transferring stock or feed; as a convertible "carry-all," passenger car, for the "hands":—

For every kind of farm hauling—this Speed Wagon will do your road-work quicker and cheaper.

Billion Dollar Agricultural Production State, 1929

By Geo. P. Clements, Los Angeles Chamber of Commerce

CALIFORNIA leads all the United States in agricultural producing counties. These are red letter days in California. We are all chirked up and filled with honest pride. The 1920 United States census has placed us in the limelight, and all our old agricultural boasts pale into insignificance in the light of facts. We have always known that our great state contributed more to the peace, happiness and prosperity of her citizens than any other state in the Union. Now we also know that acre for acre, we contribute a greater amount of food of a vastly greater variety to the people of the nation than any other state in the Union, and we have only just begun to get our gait.

Out of the 50 greatest food producing counties in the United States, California has 13 and Los Angeles heads the list with a $16,469,798 leeway over all comers. Out of the first five, California has three; out of the first ten, California has five; out of the first 17, California has eight. Surely this is just cause for exultation. They stand in place and production values as follows:

County	California Rank	Production Value	U. S. Rank
Los Angeles	1	$71,579,899	1
Fresno	2	55,110,101	2
San Joaquin	3	41,191,240	4
Tulare	4	34,036,167	7
Sonoma	5	32,300,623	8
San Bernardino	6	27,957,448	12
Orange	7	26,635,748	15
Santa Clara	8	26,135,980	17
Stanislaus	9	22,758,641	28
Sacramento	10	21,981,958	33
Riverside	11	20,253,304	40
Imperial	12	20,163,821	41
Ventura	13	19,160,414	50

A grand total of $419,265,344 out of the $1,341,700,000, or 30 per cent of the combined 50 counties.

Our nearest state rival is New York, with seven counties, the largest (St. Lawrence) taking 14th place on the census list. These seven counties have a total production of $127,570,755, or less than one-third that of California. It would seem, therefore, that we need have little if any apprehension that our laurels will ever be lifted or even questioned.

If we analyze these figures and their meaning the results are astounding. It is only within a decade that California has been considered seriously as an agricultural producing state. Nearly all our crops are totally dependent upon the artificial application of water for irrigation and scientific cultural usages in order to circumvent the shortcomings of nature to make them produce, and the area of our producing acreage is limited to but 4,095,245 acres of land out of a great state's total of 101,310,080 acres. Think what it will mean when our total 22,000,000 acres possible of irrigation are brought under cultivation and are producing. We may multiply our present state agricultural production by five and still be within the limits of conservatism.

This great victory is a victory of engineering and agricultural brains, a victory over barren plains, semi arid hills, and deserts. The glory is equally theirs, the reclamation and irrigation engineers, the state agricultural department, state and individual teachers and scientists, those redoubtable, adventurous heroes, the pioneer nesters, and the scientific California 20th Century farmer, the producer of today.

When you think that California produces commercially every flower, fruit, cereal and vegetable possible to a temperate zone, and many of the semi tropics, some idea of our great range in food production is possible, and when you realize that of the nation's food we furnish 100 per cent of the lima beans and almonds, 98 per cent of raisins and figs, 96 per cent of walnuts, 90 per cent of olives and dates, 85 per cent of grapes, 75 per cent of apricots, 70 per cent of plums and prunes, 59 per cent of asparagus, 55 per cent of the oranges, 34 per cent of all beans, 33 per cent of the lettuce, 31 per cent of peaches, 28 per cent of pears, 27 per cent of the cantaloupes, 26 per cent of the celery and potatoes, tomatoes, and hundreds of other vegetables, cereals, and animal products in greater quantities than we consume, our importance as an agricultural producing state stands out in bold relief.

We have just commenced. What will the future tell of California's agricultural production when we take into consideration that the East will not permit the California farmer to become a fixture. Every day some alluring figure is offered him for his farm, and he succumbs and sells to start afresh, and each transfer of land cuts down the production of that land, for California's agricultural usages necessary to maximum yields are uniquely her own and must be mastered by the new comer, and this takes time running into years. The Far East and Middle West farmer finds that his methods, the result of centuries of production in the East and Middle West, do not avail him anything in California. He must become a probationer.

What will it mean in figures of production when these 22,000,000 acres of agricultural land are settled and producing maximum crops upnder intensive scientific agricultural cultural methods? Can you grasp it? Our Californian soils under intensive farming offer the minimum sustaining acreages possible in America. Did we realize this more fully there would be less attempt made to indifferently farm great acreages, which results so frequently in loss, and a wide movement would be on towards the 10, 20, 40, and 80 acre farm under intensive farming methods.

It should be borne in mind that California's producing agricultural acreages represent a greater capital outlay per acre than any other place in America, and a greater investment and overhead in cost of production as well. These are the rocks upon which nearly all of our "back to the land" cooperative associations have been wrecked.

A bit of level free land means a farm anywhere else but in the Pacific Southwest. Land means nothing to us. We have 101,000,000 acres of it, some of the finest soils out of doors, yet but 22,000,000 acres have real agricultural value. Water for irrigation is the determining factor; with us an inch of water means so much agricultural land in California. Our Eastern and Middle West people are not used to taking into consideration these additional costs,—cost of water, cost of placing land ready for irrigation and cropping, cost of placing water on land convenient to irrigation of crops, and where horticulture is the object, cost of care of vineyard or orchard for three to nine years, according to variety, until in bearing. Where the capital is limited, this means great privation and frequently a longer wait, since unable to properly fertilize and care for, the time of commercial bearing may be greatly delayed. Many ways are employed to meet this wait —poultry, truck, small fruit, and berries, but they all tax the soul and need fortitude and grit to win.

We do not need to tell you what you may expect in acre returns. We do not believe that any maximum figures already arrived at will maintain. Anyway, minimum returns are the only ones for the farmer to speculate in, and his contemplated crop will determine for him his acreage necessary to sustain him. A city lot will produce 60 per cent of the living of the owner and a family of four at the average expenditure of two hours a day during growing season.

A back to the farm movement in California is to be deplored unless with sufficient capital and under the direction and advice of trained agriculturists thoroughly conversant with California's peculiar cultural requirements. The farmer in California must be an agriculturist. He must have private capital or long time credit. He must be a business man and his range of labors go beyond his fields—they must take in cooperative marketing, cooperative by-product manufacture, pest control and diverse other things. Even in the face of our wonderful showing it is safe to say but two-thirds of our production is represented in these colossal figures. At least one-third was waste. No other class of farmers face the losses such as the perishable fruits and vegetable growers. This is one of the economic questions before the farmers of the state—how to turn this loss into revenue—and it can be done. With half the world hungry and one-third of it in famine this annual loss must be turned into an imperishable by-product of available food.

Glancing back over our figures, California's agricultural production of 1919, $563,343,804, represents but the minimum production of but 4,095,345 acres or one-fifth of our possible agricultural area. It represents but two-thirds of our actual soil production under indifferent cultural methods in the main. Is it not within reason to predict that due to our rapidly increasing population our growing knowledge of scientific agriculture, our reclamation projects under way and contemplated, our attempt to check this terrific waste through by-product manufactories, that 1929 will show us figures more astounding? Yes, we should make California a billion dollar agricultural product producing state. Today we lead in agricultural production,

In scientific agricultural cultural usages.

In acre production yields.

In cooperative marketing of agricultural products.

In plant disease and pest control.

In no other country has the farmer a broader outlook.

In no other country has he the comforts and opportunities for happiness.

In no other country can he get the advice and encouragement so necessary to his success.

Our slogan should be a "Billion Dollar Agricultural Production State 1929."

Increased Efficiency Through Grinding of Feed

LIVESTOCK feeders often lose their profits by not utilizing all the feed produced on the farm. "Hogging off" is an economical way of harvesting a crop, economical from a labor standpoint but desperately wasteful of high priced crops on high priced land. Hence the silo, feed cutter and feed grinder have come to increase the efficiency of these coarser crops. Today there are combination cutters and grinders which take the ripened corn, ear stalk and leaf and produce a ground feed so finely divided as to be almost every ounce of it digestible. Not only may corn be used this way but milo, the kafirs, alfalfa hay, in fact, every kind of coarse or concentrated feed. Grinding does not increase the nutrient content but does make available all that is naturally in the stalk.

Of course there is the cost of harvesting and the cost of grinding, the latter running around $1.50 per ton. Carefully conducted experiments have proven the economy of this method of preparing feed. One who has made thorough tests of the efficiency of feed grinders writes:

"There is much nutriment in the heavy stalks, stems and vines that cattle refuse. Cattle do not refuse them because they are not nutritious, as some feeders think, but wholly because they are in a form they cannot easily assimilate. Cattle usually eat the leaves, blades, tops and fine portions, leaving the balance untouched. From 40 to 50 per cent of the feeding value of many crops is contained in the stalks, stems and vines. But cutting and grinding the stalks, corn, cane, alfalfa, clover, sheaf oats, hay or beans, peas, peanuts, etc., into a fine meal, cattle will relish the whole crop and 1300 per cent of the crop

(Continued on Page 687.)

Agricultural News Notes of the Pacific Coast

Northern California

Butte County has five olive mills operating.

Lassen County supervisors have appropriated funds for farm adviser.

A short course for prospective farmers will be given at Davis, January 2-7.

A mile and a half of the state highway south of Redding is open to travel.

A poultry registry association is planned by the Sonoma County farm bureau.

The celery shipping season is at its height. January 1 should see the end of the season

The postoffice has granted extension of Rural Route No. 1 from Orland, Butte County.

Solano County now has a farm home adviser. Miss Katherine Bennett has been appointed.

An auxiliary plant of the California Prune and Apricot Growers will be located at Colusa.

The United States forest service is sending an expert to Eldorado County to clean out the coyotes.

Lassen County has organized a farm bureau and will ask supervisors for funds to secure an agent.

A Butte County hop grower shipped last week seven carloads of hops to one English buyer. The price was 22 cents.

With a view to standardizing future apple plantings orchards of eastern Mendocino County have adopted the Jonathan.

Tehama County's supervisors are arranging with the County Fair Association to take over the fair grounds and buildings.

At the recent annual meeting of the Glenn County Fair Association it was reported that the last fair was a financial success.

Placer County fruit men held a banquet on the occasion of the distribution of the California Fruit Exchange on December 13.

Horticultural Commissioner Turner of Placer County reports an unusually busy month in pear orchards because of blight control work.

The state highway surveying crew has been making final survey of the Oroville-Quincy North Fork highway. 26 miles has been definitely located.

Yuba and Butte Counties report some damage to olives in exposed orchards. A warm rain immediately following the freeze reduced the damage.

Napa County shipped out 600 carloads of grapes during the season. It is estimated that about 1000 additional acres will be set in vineyard the coming season.

President Ramsay of the California Cattlemens Association in his annual address advocated operation of packing plants and retail meat stores by the association.

An irrigation district embracing 14,000 acres in the Fall River Valley, Shasta County, is being organized. Water will be secured by pumping from Fall River.

The Trinity national forest in 1922 will furnish grazing to 15,000 cattle, 24,600 sheep and goats, 600 swine. Applications should be filed with supervisors at Weaverville before February 28. Rates same as last year.

Central California

Wasonville had a community Christmas tree.

Porterville is shipping 50 to 75 carloads of oranges daily.

Many Stockton potato growers are storing in hope of better prices.

Lindsay won orange sweepstakes at the Valley Citrus Fair at Visalia.

A standard pack for Emperor grapes is being considered by a committee of growers.

There will be a farm bureau hog auction sale at Wasco, Kern County, January 7.

The Kern County farm bureau is planning to hold several farm accounting schools.

Lindsay's orange shipments are practically over. Estimated total is 1,700 carloads.

Tranquillity district, Fresno County, ranchers are to plant 500 acres to vines next year.

Fresno County supervisors are calling for bids on 16½ miles of highway and seven bridges.

Dr. F. T. Bioletti of the state university gave olive pruning demonstration at Strathmore, December 19.

Tulare County shipped 4,489 cars of fresh deciduous fruits in 1921 as against 3,324 cars for the preceding year.

Raisin Day committees are already at work planning the 1922 celebration. An industrial show will be one of the features.

Fig growers in the association have received final payment on the 1920 crop. This was for figs received last February.

The packing plant of the raisin association at Kerman was closed the middle of the month. This plant has handled 1,800 tons.

The county highway between Santa Cruz and the Big Trees is now open to traffic. Much of the road is paved, the rest rocked and rolled.

Merced is planning to send a delegation of 100 fig growers to the fig institute at Fresno in January to bring the 1923 institute to Merced.

The Modesto irrigation district will sell on January 11 the eighth issue of Don Pedro bonds, $181,600, to be used for power house construction.

Hog raisers of Fresno County have organized a department in the farm bureau and will hold an annual pork day similar to the one held at Hanford.

President Giffen of the Sun-Maid Growers has returned from a trip through the Imperial, Yuma and Salt River Valleys to look into prospects of those sections as raisin producers.

The swine department of the Fresno County farm bureau is making plans for next fall's Pork Day, when $1,000 in cash prizes will be distributed. After the judging several carloads of hogs will be sold at auction.

The projected West Side highway from Fresno to Tracy, to provide a new paved route from Fresno to San Francisco, has been endorsed by the Fresno County chamber of commerce.

Three deciduous pruning demonstrations were held in Kern County, December 29 and 30, at Kern Mesa, Wasco and Tehachapi. L. H. Day of the state university conducted the demonstrations, aided by the farm adviser.

Southern California

A poultry and pet stock show will be held at San Diego, January 5-9.

Imperial Valley turkey raisers have been getting 40 cents for Christmas turkeys.

The sugar factory at Anaheim, Orange County, is planning to build a $250,000 addition.

Dairymen at Meloland, Imperial Valley, are taking steps to form a cow testing association.

A carload of oranges for the Christmas trade left Rialto, San Bernardino County, December 9.

The Anaheim Valencia show has decided to incorporate to place the venture on a business basis.

Tractor school at Covina, January 16-17. Many enrollments are coming in to the farm adviser's office.

The Mojave Valley Fruit Association is planning to build a packing house at Victorville the coming season.

Olive growers of Santa Barbara County are wondering if they can find a market for their crop through the farm bureau.

The Los Angeles County farm bureau is arranging for a series of navel orange pruning demonstrations early in the year.

At its last meeting at Hemet the Associated Chambers of Commerce of Riverside County discussed Colorado River development.

A. W. La Forge of Chino has been testing out many varieties of beans as intercrops in his walnut orchard and finds kidneys the most profitable.

Sierra Madre reports rainfall for the storm, over 15 inches. All Southern California except desert sections received from three and a half inches up.

The semi-final pool of Valencias of the Santiago Orange Growers' Association, Orange County, realized $374,000. There were 200 growers in the pool.

The Riverside-Arlington Heights Exchange shipped during the season 886,792 boxes of oranges. Total cost for marketing the fruit was 6¾ cents a box.

Three days' demonstrations of special interest to grape growers in Los Angeles County will be given by Prof. F. T. Bioletti, January 14, 16, 17, in various grape growing sections.

The poultry industry of Ramona, San Diego County, this year shows an increase of 20 per cent over that of last year, the shipment of eggs from the valley amounting to 10,000 cases.

Growers at the citrus institute at Santa Ana last week declared themselves in favor of an insectary to be financed and controlled by themselves to help in control of pests of Orange County orchards.

Orange County has guaranteed to ship 1,000 cars of citrus fruit through the Panama. The McPherson Heights Citrus Association figures that if its 95 cars of Valencias were shipped by water instead of by rail it would save $28,200.

Orange, Imperial and Los Angeles Counties are now being canvassed by R. L. Adams of the state university for data on dairy costs, figures to be used by the state legislature. Twenty-three counties are being canvassed for similar figures.

The Coast and General

The Wenatchee Horticultural Society, Washington, favors adoption of permanent fruit grading rules.

Seven counties of South Dakota applied last summer 130 tons of poison bran mash to 25,000 acres of growing crops.

The office of the Northwest Wheat Growers Association will be moved from Spokane to Portland within a short time.

Wenatchee apple shippers now have a water rate via Seattle to Atlantic ports of 62 cents a box, 19 cents less than the rail rate.

The federal government has established a plant quarantine for Hawaii, to protect from pests now on the mainland but not yet in the islands.

The Farmers Union for Oregon and Southern Idaho has reelected A. R. Shumway of Milton, president. F. A. Sikes of Corvallis is secretary-treasurer.

The annual Oregon irrigation congress was held last week. The three chief projects to be considered were the Klamath Falls, Umatilla and Powder River.

Berry growers of the Puyallup valley of Washington, with lower prices but also lower costs of production, netted more than from crops of last two years.

A branch of the Washington Egg and Poultry Association is being organized in the Yakima Valley. The aim is to sign up owners of at least 50,000 hens.

Prospective grape growers of Yuma Valley met at Yuma December 2 to form an organization and make plans for importing and planting cuttings and rooted vines.

At the meeting of the National Association of Polled Durham breeders at Chicago during the International Dan B. Thieman of Higginsville, Missouri, was elected president.

More than 3,000,000 pounds of the 1921 crop of prunes have been shipped to various markets of the world by the Oregon Growers' Cooperative Association, with headquarters in Salem.

The annual ham and bacon show of the Missouri college of agriculture will be held at Columbia, January 16-20. $165 in cash and silver cups will be awarded for best home cured meat.

Florida shippers and growers are protesting against the 10 per cent freight cut in effect December 15. They say that nothing less than a 33 1-3 per cent cut will be satisfactory.

Plans are already being made for an auction sale of show and utility poultry in connection with the Western Winter Show of the Oregon Poultry and Pet Stock Association, in connection with the Pacific International Livestock Exposition of 1922.

The National Livestock Producers Association has as its first board of directors: John G. Brown, Monon, Indiana; E. H. Cunningham, Des Moines, Iowa; C. A. Ewing, Decatur, Illinois; Harry G. Beale, Mt. Sterling, Ohio; Howard M. Gore, Clarksburg, West Virginia; O. O. Wolf, Ottawa, Kansas; C. E. Collins, Kit Carson, Colorado; Hugh Sproat, Boise, Idaho; J. E. Boog-Scott, Coleman, Texas. They will carry out the cooperative livestock marketing plan worked out by the American Farm Bureau Federation.

Relation of the Honey Bee to Deciduous Fruit Production

By A. H. Hendrickson

THE relation of the honey bee to the production of deciduous fruit is a question that interests both the beekeeper and the fruit grower. In the early days of horticulture nearly every farm kept a few bees as a side line, but of late years this practice has almost entirely disappeared. The fruit farm with a number of colonies of bees is now the exception rather than the rule. Sporadic attempts have been made from time to time to interest orchardists in general in keeping bees, but almost invariably they have resulted in failure. The orchardist was a fruit grower and not a beekeeper, hence soon lost interest when he began to lose swarms and his colonies became diseased. Steadily diminishing crops in many of the highly specialized fruit sections have caused a widespread interest in anything that will bring up the yield. Attention has been redirected to the humble bee as the connecting link between trees and fruit.

Actual experiments with honey bees in orchards were carried on over 30 years ago. Professor A. J. Cook proved the value of bees in apple orchards. He gave substantial figures to back his claims. In 1893 at a California state fruit growers' convention several observers reported on the value of bees in their respective districts. As early as 1894 a government report showed that the cherry crop in a large orchard near Vacaville was greatly increased when several colonies of bees were placed in the orchard. It is interesting to note that this ranch today keeps a large number of bees and produces large crops consistently year after year. Yet on other ranches in the same section where crops were erratic, the owners did not believe that bees were in any way responsible. In spite of this information printed in the reports of the state commission of horticulture, many growers had no conception of the importance of these useful insects. Many ranchers went to the opposite extreme and disposed of their bees, claiming they were a nuisance at drying time and generally hard to care for. In 1916 and 1917 the University of California, by means of tents of mosquito netting over prune trees, proved conclusively the value of bees in prune orchards. Since that time the use of these insects in the Santa Clara Valley and elsewhere has steadily increased. In 1921 the results of similar experiments demonstrated to the Placer County growers the need of bees for their plums. From interest shown thus far it would seem that this district would be a promising field for an energetic beeman with several hundred colonies to rent.

Process of Fertilization

Before proceeding farther it would be well to stop and consider briefly what is necessary to secure a set of fruit. The importance of bees is more fully realized when the intricate process of fertilization is understood. Assuming that the orchard has been given normal care, the trees will blossom in a satisfactory manner at the proper time. Each blossom produces one or more pistils, as the case may be; a large number of stamens; a row of showy white or pink petals; and, on the outside, a row of green sepals. The important organs are the first two, the petals being largely for show. The pistil or female portion consists of a young fruit in which is located the unfertilized egg and above which is a rather long slender stalk surmounted by a flattened sticky surface called the stigma. The stamens or male elements are long slender filaments bearing the anthers which enclose large quantities of pollen. Deep down in the flower is usually the nectary which secretes the honey. At the proper time the pollen falls upon the stigma, germinates, and sends down a tube through the pistil to the egg. The male nucleus passes into the egg and unites with the female nucleus, completing the process of fertilization. Under this stimulus the young fruit develops very rapidly. If the egg is not fertilized in a comparatively short time it shrivels and the young fruit turns yellow and falls to the ground.

The egg or young ovule remains receptive for perhaps several days depending somewhat upon the climatic conditions. If not fertilized during that time it begins to disintegrate and the young fruit is doomed to fall. Many potential fruits are lost each year because the egg was beyond its receptive stage before the pollen tube reached it. Thus, the rate of growth of the pollen tube down the style becomes a very important factor. If the growth is slow, disintegration of the egg may commence before the nucleus can pass over and complete the process of fertilization. Experiments have shown that pollen tubes grow much slower in cold weather than in warm, which may help to account for light crop following cold springs. Pollen tubes also grow much slower in self pollinated flowers than in cross pollinated ones. Self pollinated fruits are those pollinated with the pollen from the same variety. Cross pollinated fruits are those produced when pollen from another variety is used. This slow growth may be one of the fundamental causes of sterility among deciduous tree fruits. For full setting it would seem that the ideal conditions would be fairly warm clear weather and ample facilities for cross pollination so that a strong, active growth would be secured in the pollen tubes.

In addition to this impediment to self pollination just described, nature has also provided others which are more obvious. Many fruits like the plum and apple do not have the pistil and stamens maturing at the same time. While the pistil is receptive the pollen is not yet mature. Consequently pollen from another variety must be placed on the pistil to secure fertilization. Another factor is the one of difference in length of the important organs. In certain varieties of almonds, cherries and plums the pistil is so much longer than the stamens there is no possibility of the pollen dropping on the stigma. An exception to this rule seems to be the apricot and possibly the peach. With but few exceptions the pollen must be transferred mechanically to the stigma of the same or different flowers. Insects and wind are the only two distributing agents worthy of mention. For practically all of our tree fruits except walnuts wind as a pollen carrier may be considered as practically negligible in value. Insects are the effective pollen carriers. No one knows exactly of what importance each one is, but the honey bee is usually considered the most valuable. Increased crops due to the addition of bees to the orchard is ample proof of this statement.

Fruits Requiring Cross Fertilization

Bees are a vital necessity with

(Continued on Page 688.)

10,000 Dozen Eggs From 600 Hens

By Jean A Koethen

IT sounds like a fairy story. When we consider that ten dozen eggs per year per hen is considered the general average for the whole state, an average of 18 dozen per year from a flock of 600 hens may well be counted phenomenal, yet that is a little under the average reached by the flock of L. G. Wylie of Van Nuys in the Holly Hatchery egg laying contest which closed September 30.

The contestants who completed the year's work were: L. G. Wylie, Van Nuys, 600 pullets, averaging 217.09 eggs each, all in one flock; chicks hatched February 19 and 26, 1920. C. S. Hinkley, Redlands, 700 pullets, averaging 186.69 eggs each, in two flocks; hatched February 25, 1920. A. W. Horswill, Pasadena, 540 pullets, averaging 176.67 eggs each, in two flocks; hatched March 4, 1920. Walter Fletcher, Redlands, 70 pullets, averaging 175.14 eggs each; hatched January 28, 1920. Brant Rancho, Owensmouth, 320 pullets, averaging 172.59 eggs each; hatched February 26 and April 29, 1920. Henning Carlson, Owensmouth, 925 pullets, averaging 172.16 eggs each; hatched April 15, 1920. Mrs. McD. Cantrell, Pasadena, 800 pullets, averaging 171.76 eggs each; hatched February 5, March 11 and April 28, 1920. Butler L. Pierce, San Bernardino, 1,009 pullets, averaging 170.8 eggs each; hatched April 14, 1920. C. G. Ross, Pomona, 340 pullets, averaging 166.11 eggs each; hatched March 25, 1920. Mr. White, the leader for the whole year, received $300, Mr. Hinkley received $200 and Mr. Horswill $100. Mr. Horswill's record was remarkable because it was made on two town lots, his hens clearing the neat little sum of $4,000 in the year. Mr. Pierce's record was notable in that it was made with a larger number of pullets than was entered by any other contestant, and with April hatched pullets at that. Mr. Fletcher's 70 pullets were a backyard flock.

How They Did It

How did Mr. Wylie manage to make so notable a record with so large a flock? At the state and national egg laying contests many pens of five or ten pullets make big records, but Mr. Wylie had 600 pullets, all in one flock. It was in part to answer this question that Mr. Holloway invited the contestants and others interested to meet him at Van Nuys on December 9 in celebration of the close of the contest. After lunch at the Van Nuys Country Club the party motored in several big machines to the Wylie ranch on Sherman Way to see the 600 thrifty hens that had acquitted themselves so well and learn from Mr. Wylie how he managed them.

The story is not essentially different from any other story of success with laying hens. Good stock, carefully raised, brought to laying maturity at the right time, kept in clean houses, fed a balanced ration and an abundance of greens will always lay. Possibly the keynote of Mr. Wylie's management is absolute cleanliness. Certainly he spares no pains to keep houses and air and the bodies of the hens themselves as chemically pure as is possible under the circumstances.

Housing the Chicks

Mr. Wylie's chicks were hatched in February, which is undoubtedly the best month in the year for hatching. They were housed in one of the regular laying houses, 1,600 chicks to a 16 by 18 house, around a big brood stove, a plan which many poultry people now follow, and which eliminates the brooder house entirely. The stove stands on the floor and the chicks are brooded about it for six weeks. When roosting time comes, a slatted roosting frame is laid upon the roosts above the droppings board and a lath panel placed in front. After one night the lath panels are used as ladders and the chicks quickly find their places on the roosts.

The more precocious cockerels are taken from the flock at the end of three weeks, and by the end of the fifth week only pullets are left. All cockerels are sold at six weeks of age.

The house opens into two big yards, one 54 feet square, the other 25 by 200. When the chicks get out onto the ground they find both these yards filled with barley which has been allowed to grow to full height. Here they run and play and hunt for bugs, and make a very rapid growth from babies to half grown chickens. In such a run as this the chicks never find time for toe picking, and one bugbear of chick raising is eliminated. Plenty of green range is also a preventive of coccidiosis, which is found mostly in overfed, underexercised flocks.

Feeding

These chicks were hatched on Monday but not fed till Friday. They were placed on the clean straw about the brooder stove and given piles of charcoal to pick at. After the third day skim milk was given in fountains. On Friday morning a mixture of cracked wheat, fine cracked corn and steel cut oats was placed before them on small trays, according to the poultry division feeding system, and no other food was given for four or five days. When the dry mash was placed before the chicks at the end of the fifth or sixth day it was left for only a short time in the forenoon and again in the afternoon. The time of leaving it was gradually increased till by the end of the

OUR ADVERTISERS RELIABLE

We guarantee our subscribers against loss through dishonesty of any advertiser in the Cultivator. We do not attempt, however, to adjust trifling differences between subscribers and honest, responsible advertisers, nor will we pay the debts of honest bankrupts. Notice of complaint must be sent us within 30 days from date of the transaction, and the subscriber must have mentioned the Cultivator when writing the advertiser.

Cultivator's weekly circulation If among the more than 40,000 any fail to find any article they desire to purchase advertised in the Cultivator's columns, a special request is extended you to let your wants be known to the California Cultivator and we will place you in touch with proper parties.

EDITORIALETTES

Look on this scene, then on that. We refer to those two scenes on the cover. One of them gives an idea of one of California's rich valleys—oranges, lemons, olives, avocados and other semi-tropical fruits are within sight. There is a bit of a hint of Eastern conditions at the same moment on the mountain tops, but even they add cheer to the landscape below. The little inset in the upper right hand corner is really "back East." Snow is all right for tracking rabbits, but mighty poor stuff when it comes to shoveling a path out to the barn.

* * *

We think perhaps one reason why California orchards sometimes command two or three thousand dollars per acre while New York or some of those states which are covered with the "beautiful" sell their lands at one or, possibly, two hundred dollars is this difference in climate. We can produce New York climate to perfection on our mountain tops but New York's most beautiful little valleys cannot produce a California orange grove. Hence the difference in price.

* * *

That much from a climate standpoint. From a pocketbook standpoint there is even greater difference. The best corn field in the hog belt would not justify the thousand dollar an acre price, but when California climate and soil and water all are brought together the golden orange is produced which means long return.

* * *

The orange is not the only "different" crop, for no section of the world has the diversity of production which can be shown in California. Speaking of corn, the census returns show the per acre production of California corn fields greater than that of the regular so-called corn states. This is in part due to soil and in part to irrigation, so that California can produce corn. Its total tonnage is not large simply because there are other things we can produce more perfectly.

* * *

They say that the California state railroad commission has announced that it will protect capital invested in railways to the end that stockholders may have fair return on their money. This is well and carries out the general idea that large aggregations of capital are sacred; it absolutely must not be impaired. The blooming farmer who asks such fool questions as "What about capital invested in my farm," should shut up. That ain't sacred or, rather, it should be willingly sacrificed to bear the brunt of reconstruction. Protect and reimburse the bond and stockholder and soak it to the farmer. He is long suffering and will stand the gaff but ultimately will be willing to sell his farm, if he can, and invest his money, if he has any after paying the mortgage, in stocks and bonds which are sacred. Then, if he hasn't already gone to the devil, will prosperity be his.

* * *

HAPPY NEW YEAR

Now all together: "Happy New Year." The rains have been poured out upon the rich soil; the plows are starting; all nature is uniting in good cheer. We are hoping that transportation rates will be such that the wonderful crops we may now grow may be taken to market and that we will have living wage, so anticipate the pleasure of another Thanksgiving season with abundance.

MORE RAIN

Last week we spoke of floods and the great downpour covering two days. Every day since there has been gentle precipitation until the total has mounted—on the top of Mount Wilson—to nearly two and a half feet. In orchard sections it has been somewhat lighter. Eureka reports for the season 12.25 inches; Red Bluff, 9.31; Sacramento, 5.44; San Francisco, 8.56; San Jose, 6.51; Fresno, 3.56. The downpour in the South has been more abundant and for this one storm covering the past nine days the record shows: Los Angeles, 7.90; Glendale, 13.18; Corona, 9.09; Santa Paula, 10.66; Bakersfield, 2.03; Tehachapi, 2.18; Redlands, 8.76; Pasadena, 11.59; Monrovia, 9.68; Glendora, 10.36; Orange, 7.91; Riverside, 6.63; Ontario, 10.64; Sierra Madre, 17.73; Pomona, 8.88; Santa Barbara, 7.73; Beaumont. 14.43; Ventura, 7.36; San Diego, 9.25. The seasonal precipitation at these southern points will run from one to three inches above the figures for the one storm. And the end is not yet!

STILL WE LEAD

There are 51,453 acres of the best soil of the United States used in growing nursery trees, and the leader is New York with 5,288 acres. The next is California with 4,080. The comparative values of the acreage in New York and in California are vividly shown in the financial returns. While New York's five thousand acres brings in a total of nursery stock to the value of $2,310,253, California's four thousand produce stock valued at practically $3,000,000, or, to be exact, $2,929,458.

In number of nurseries California also leads with 540 against 359 for New York. There are only six states producing nursery stock exceeding in value a million dollars. These are in the order named: California, New York, Ohio, New Jersey, Missouri, Pennsylvania.

These figures do not have to do with greenhouses, neither with seed farms. Of course in seed production no state in the Union approaches California.

SAVE THE LEAK

Secretary Kruckman of the League of the Southwest reviews some of the work of the league, also touches upon the dissension during the recent meeting. As was reported in the Cultivator the Riverside meeting was not entirely harmonious for a truly cooperative spirit was not manifested by many, especially one or two of the states which allowed the selfish spirit to overcome the cooperative. This selfish spirit would if it could utilize the great forces of the Colorado River for the benefit of the few, and if the League of the Southwest stands in the way, then the league should be wrecked. Mr. Kruckman said:

"It is very puzzling to watch the campaign now in progress to submarine the league. Newspapers innocently through the inspiration of interested persons have been led to publish glaring mis-statements which they have voluntarily corrected. Healthier and stronger and more coordinate than ever, yet the propaganda is spread broadcast that the league is either dead or dying. Why this insistence upon a funeral? Who is spending good money and much valuable time to bury a very lusty and powerfully growing organization? Why this organized and systematic campaign of mud-heaving and innuendo? Why is it so important to make an effort to kill the league? Who or what is hurt by public discussion of the Colorado River problems?"

Pitiless publicity is not what is desired by those who are endeavoring to acquire these rights, in fact, they suggest "that a small group of gentlemen gathered around a comfortable table far from the maddening crowd can function much more effectively upon a problem like the Colorado River than an organization like the League of the Southwest, which, in the classic words of Dr. R. B. von KleinSmid, is dedicated to the business of providing an absolutely impartial, unbiased and nonpartisan forum, which is open, where the Southwest may gather occasionally to discuss such problems of paramount interest as the Colorado River."

LET US BE FAIR TO OTHERS, FAIR TO OURSELVES

The best news which has come to the Southwest in many a day was that brought by Secretary of the Interior Fall when he intimated that more perfect development of the energies of the great Rio Colorado would begin in the near future. He was conservative in his statements as to exact date of the beginning, but "as soon as the rights of two nations and seven states can be determined." In any case we are all most hopeful that the floods will be held back before they cause irreparable damage on the lower river courses. Meantime we are each presenting our ideas of the various claims to the great wealth now wasting to the sea.

Some of the discussion which resulted from the congress of the League of the Southwest and from the hearings of Secretary Fall at San Diego was reported in the columns of the California Cultivator as fully as possible. We would have been glad to have given more space in order to aid in the work which will in any case be all too long of accomplishment. But as short as the account necessarily was we endeavored to do justice to all.

In response to our treatment of the subject we received from Dean D. W. Working of the agricultural college of the University of Arizona the following letter:

"I have been reading the editorial page and editorial correspondence in your issue of December 17 and wish to express my pleasure in regard to the way in which you have discussed the whole problem of the recent league meeting. This college of agriculture was represented at the Riverside conference by Professor G. E. P. Smith of our department of irrigation. Mr. Smith has read your discussion at my suggestion and agrees with me that you have made an admirable presentation of the meeting that was difficult to present to the public without certain expressions of impatience.

"We were particularly interested in your paragraph referring to the danger to the Imperial Valley by floods from the Colorado itself and from the Gila; and also in the paragraph in which you express the opinion that the principle of the greatest good for the greatest number will be the policy of the federal government in the control of the waters of the Colorado River. It is important, it seems to me, that those who have the best interests of the whole Southwest at heart should be careful to keep before the public the idea that it is only by arriving at a common understanding that the states of the Southwest can get satisfactory results from the agitation for the development of power and irrigation from the Colorado River.

"I have attended a number of conferences at which broad interstate problems were under consideration, and I have observed that many of those who insist with undue vigor on the importance of state rights are men who are unwilling to give fair consideration to the rights of other states than their own. Usually the state rights plea is a plea for selfish advantage. I suspect that we shall all profit by the fact that the Colorado is both an interstate and an international stream. We shall have to consider, whether we will or no, the interests of Mexico along with our own particular interests in the river.

"I hope that you will continue discussions concerning the Colorado River and the development of its resources. All of us in all of the states which comprise the drainage basin of the river need to use a part of the water of the river and our proper share of its power resources. You of California and our neighbors of Mexico need to be protected against the menace of floods. A proper control of the river under national authority can be made to give every state all of the water for irrigation it is able to use wisely and all the power it can properly use in justice to the interests of other states. The big thing to be accomplished is to secure a right attitude of mind when considering and discussing the use to be made of the water of the Colorado River and its tributaries."

Building Up Soils vs. Feeding Crops

By R. R. Snowden, Agricultural Chemist

THE question is often asked, "Should I aim to feed the crop or build up the soil?" I say, by all means, build up the soil, which means create and maintain conditions in the soil most favorable to root extension and plant development—then feed the crop by supplying in available forms all those fertilizer elements that are deficient in the soil. The fundamental need in agriculture (which includes horticulture) is oxidation. This can only be attained by securing such openness of the soil as will permit adequate movement of air and moisture within the soil mass to the required depth, which varies with the different crops grown. Oxidation is so necessary that it is often synonymous with fertility. This object is attained by opening up the heavy clay with gypsum or slaked lime (or quick lime), aided by large additions of vegetable matter incorporated as deeply as possible. It is also encouraged by catalytic agents such as manganese, red iron oxide and other efficient purveyors of oxygen, which oxidize without being used up in the operation; and by the nitrifying bacteria which unite the oxygen of the soil air to the soil nitrogen to form nitrates. These bacteria must have nitrogen in combination, the free air of the more or less open soil, moisture, calcium carbonate to neutralize the nitric acid they produce, vegetable matter (which always contains carbohydrates—cellulose, starch, sugar), a range of temperature between certain limits. These the farmer must supply, and upon the thoroughness of his work depends his success. The farmer can influence the temperature factor in several ways, first by selection of a sunny or other slope for his field; second by selection of the proper season for planting; and the temperature may be further modified by the production of humus in the soil to darken its color, for dark colored soils are relatively warmer than light colored ones. In the early spring before the soil becomes warm enough for the nitrifying bacteria to do their work the addition of nitrates in suitable quantity is imperative, in the case of annuals, to give the plants a strong start, and in that of perennials, such as fruit trees, to form strong fruit buds, removing as much as possible restraint upon their development.

It is astonishing what can be done for vegetation through the medium of the soil along lines which seem to have no relation whatever to soil conditions. For instance, a Santa Barbara lemon grower put lime (old wall plaster) around some of his young lemon trees in the summer time. The following winter a freeze killed to the ground all the trees that received no lime, while those receiving it simply shed their leaves, and a few where the wagon stood, that accidentally received an extra supply of the lime, were not visibly affected by the cold and did not even drop their leaves. A Covina orange grower found after a freeze 95 per cent of his fruit uninjured where he had treated the soil liberally with sawdust, while the whole crop was lost in the untreated parts. Another Covina orange grower dynamited the hardpan in his orchard, but at my request he left a row with hardpan intact. The row left with hardpan was badly injured by cold the

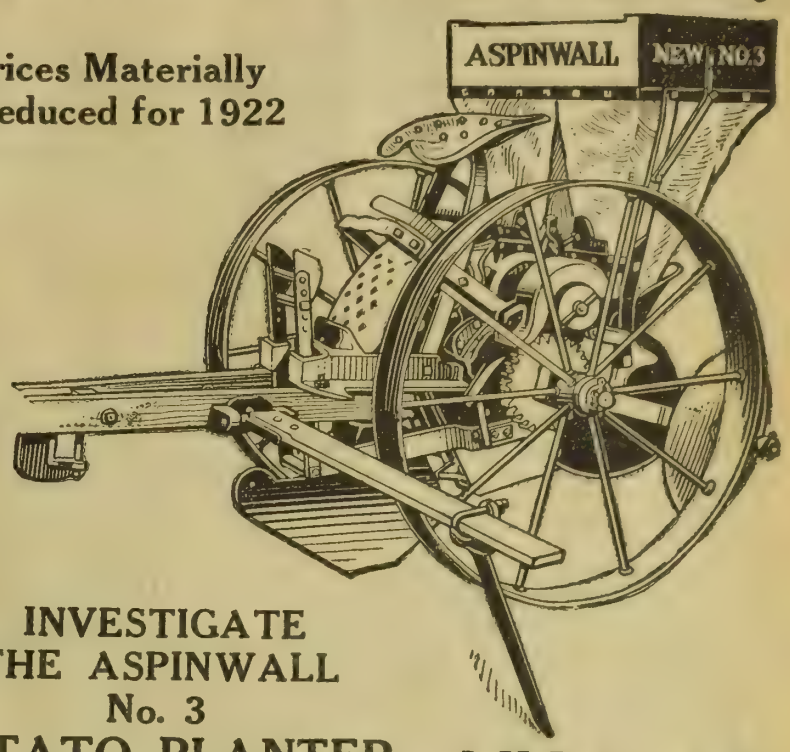
Aspinwall Potato Machinery

Prices Materially Reduced for 1922



INVESTIGATE THE ASPINWALL No. 3 POTATO PLANTER

With or Without Fertilizer Attachment

The secret of the success of the ASPINWALL POTATO PLANTER is in the fact that it is AUTOMATIC, ECONOMICAL, EFFICIENT, and requires only ONE MAN TO OPERATE. It is the 100% planter—less labor, less time lost and less waste of seed. One man can plant from five to eight acres a day and PLANT THEM RIGHT.

The new 1922 prices on Aspinwall Potato Machinery permits you to buy the best at no more than cheaper, less reliable potato machinery.

The New Aspinwall No. 3, with or without the fertilizer attachment, is absolutely automatic, is free from trouble and positive in its planting.

The new price is so low that you can afford to replace your old planter with a new No. 3 Aspinwall. Write for folder and 1922 quotation.

Oliver riding two row cultivator does your cultivating, furrowing and hilling.

We can supply your needs for other implements of standard quality at surprisingly low prices.

For Sale---75,000 Cuttings

Rooted and Not Rooted, of a Wonderful Resistant Grape Vine

which will bear without being grafted

The "MASSON SALVATOR" Grape Vine

The only satisfactory, absolutely resistant direct bearer grape vine now obtainable in America.

It is a Hybrid, two-thirds Rupestris, one-third Teinturier—a prolific bearer, tried many years under all soils and climatic conditions.
It readily takes root from cuttings and produces a juice of a color intensity far superior to the Alicante Bouchet.

Rudiments of Citrus Fertilization

By E. L. Koethen

CERTAIN chemical elements are essential to the normal growth of all terrestrial plants. The composition of economic plants being variable, the composition of the soil in which they are to grow may vary greatly with the nature of the plants grown. So also the requirements may vary for physical reasons. To illustrate, certain kinds of plants thrive as well or better in soils heavily impregnated with alkali, while the citrus is quite impatient of it. Salt in large quantities is often placed on asparagus beds. Also wheat may be grown on soil so rich in nitrogen as to make the straw too heavy, causing the grain to lodge. So in order not to be misunderstood in these papers let us make it clear that we are dealing with citrus orchards, and what we say might not apply at all to many other kinds of cultures.

There are 18 natural elements mentioned by authorities as soil constituents, of which about 14 help make up the structure of plants. Even some of these 14 have no functions to perform in plant life that are known, but as they are all found in the plant structure it is taken by inference that they are needed or they would not so appear. For instance, titanium, though always present, has value so obscure as to have escaped the vigilance of the investigator.

The volatile elements in plant structure are oxygen, carbon, hydrogen, nitrogen. These may be taken into the plant either from the air direct or from the soil in combination with other elements. The other elements found in soil structure are potassium, sodium, calcium, magnesium, iron, manganese, phosphorus, sulphur, chlorine, iodine, silicon, titanium, aluminum, fluorine. Of these silicon is the most abundant, then come in succession aluminum, calcium and magnesium. These four make up the great bulk of the soil, of which the former in combination with oxygen makes up nearly 58 per cent of most soils. The great bulk of this soil mass is "filler," as it would be termed in the fertilizer factory or "roughage" in the parlance of the stock feeder. Plant food must be administered in diluted doses, so nature provides that the actual plant food shall be disseminated in a body of other materials that act as a carrier. At the same time they render service in a mechanical way. For instance, it is this filler that determines whether the soil shall be light or heavy, close or loose, friable or sticky, and these qualities are acted upon to a greater or less degree by the other fertilizing elements, to modify these qualities. To illustrate, the addition of lime to a soil may and usually does flocculate it (make it crumble). The same application to a sandy soil will give it greater coherence.

Again some of these elements while used in small quantities by the plants may become poisonous to them if found in excessive proportions. Or it may be that they are just injurious to certain plants that would not injure others. This is true of sodium forming alkalies and to a less degree of lime if in excess. Certain soils in central California have been found of this character.

Drouth Resistant Plants

By Ernest Braunton

DURING the past few years vegetation in all parts of California has been put to severe tests to withstand, without the aid of man, the unusual dry conditions. From a study of the situation in various localities one is enabled to judge how various species passed through the ordeal and to draw some broad general conclusions.

To those who would plant in dry districts or on lands incapable of irrigation it is safe to recommend native vegetation in general. There are a few native trees that are exacting. The redwood revels only in districts of heaviest fogs and thrives best in moist bottom lands. All know that willows, poplars, alders and sycamores inhabit watersides, yet the sycamore stands drouth very well. Aside from these it is fairly safe for the dry planter to pin his faith to native trees and shrubs. Among smaller plants he should be able to choose those that grow on dry ground in his or similar district.

When we come to classes it is well to remember that nearly all pines, junipers and cypresses will grow with very little water; though all will grow faster and present a finer appearance if occasionally irrigated during summer, especially early summer. During late summer it is as well not to irrigate unless the first seasonable rains are late. One more general conclusion is fairly safe—trees and shrubs from Australia and South Africa, coming as they do from climates somewhat like our own as regards wet and dry seasons, will compare favorably with native Californias under stress of long continued dry weather.

Two genera of trees and shrubs, mostly from Australia, require little water in order to retain life for a term of years. While eucalypts are natives only to Australasia, acacias are common in parts of Africa, and we have one species in this country, all of which inhabit dry lands. South America, Mexico and even Japan contribute a few plants that progress with little encouragement in the way of drinks. On the other hand eucalypts are far from being the leaders in tolerance of continued drouth and the acacias surpass them in this respect. Of the acacias the one which first succumbs to thirst is the blackwood, Acacia melanoxylon. Its native haunts are rich river bottom lands in Australia and every dry year in California witnesses the death by drouth of many large trees of this species. Sudden death, too, comes to this acacia from striking an impervious hardpan. Each year we also note the demise of trees of the common blue and red gums by reason of extreme thirst. A mysterious trouble is also taking off eucalypts that are favorably situated in regard to soil moisture. Its action is similar to root fungus (armillaria) of the oak.

In addition to our live oaks, which are drouth resistant, is the cork oak, native to mountainsides and dry hillsides of Spain. It has been severely tested from San Francisco to San Diego and from the dry hilltops of Berkeley to those of University Heights. In the southern city it has stood the test well. The casuarinas, or beefwoods, the carob, or St. John's bread, grevillea, pepper and jacaranda from South America, the Himalaya and other true cedars and the Australian pittosporums are others that hold up well, though the last named develops slowly without water. In deciduous trees the drouth resisters are not so common, but conspicuous in this respect are the umbrella, the locusts, the Arizona ash, the European hornbean (carpinus), Koelreuteria and a few of lesser stature at maturity.

In shrubs there are some lowly acacias that qualify very well for dry planting, and it may be well to state here one general consideration overlooked: that as a rule all prostrate species having upright congeners (in the same genera or genus) are srongly resistant to drouth, whether junipers, cotoneasters or others. The leader in shrubs on an extremely meager water supply appears to be the Spanish broom, Spartium junceum, sometimes sold under the horticultural name of Genista Hispanica. On one dry hillside with but four to six inches of soil it survived when several other common shrubs perished. The leptospermums, close relatives of the eucalypts, are splendid for dry places, cannot be surpassed, in fact, as they always present a good appearance, no matter how dry the location. The Australian bottle brushes, callistem-

ons, melaleucas, and metrosidros, also close to eucalypts, are equally indifferent to moisture supply. Next comes a number of brooms, species of cytisus and genista. The privets, especially the Japanese, or Ligustrum Japonicum, revels in heat and drouth. Others are the rock roses (cistus), cassias, eleagnus, the Japanese nandina and last, but a leader for arid sections, the common pomegranate. Among shrubs which may also be used as vines there is no other that so thrives with little soil or water as the blue flowered plumbago.

PROF. BIOLETTI IN LOS ANGELES COUNTY

The agricultural extension service for Los Angeles County has secured Prof. F. T. Bioletti for a series of meetings, January 14, 16 and 17. Prof. Bioletti will discuss cultural problems of the grape, pruning, staking and trellising of one year old vines, and pruning of old vines. Last spring he made a survey of the Antelope and San Fernando Valleys for their adaptability to grapes, and his findings will be discussed at two of these meetings. The schedule for the series is as follows:

January 14, 10. A. M., Littlerock, at Miller's place. Pruning and staking of one year old vines. Pruning of old vines. 2 P. M., Lancaster, at school house, "Future of the Grape Industry for the Antelope Valley" and "Cultural Problems."

January 16, 9:30 A. M., Owensmouth, place of J. C. Craig, on Corbin Street, one mile off Sherman Way. Pruning and staking of one year old Malagas, Sultanas and Thompson Seedless varieties. Adjourn to place of Norman Johnson, about a half mile north of school house on the boulevard, for pruning of old vines. 12 M., lunch served at the Chatsworth Social Hall by women of the church, price 75 cents. Those desiring to take advantage of this notify Norman Johnson, Chatsworth, by mail before January 16. 2:30 P. M., Zelzah, at Women's Club House. Lecture on "The Future of the Grape Industry for the San Fernando Valley" and "Cultural Problems." 7:45 P. M., Los Angeles city farm bureau center meeting at Central Intermediate High School at 451 North Hill Street. The Angeleno Heights car is the nearest to the school. Lecture by Prof. Bioletti on "Grape Culture."

January 17, 10 A. M., San Fernando, at place of Dr. J. H. D. Budau, off San Fernando Road on Hubbard Avenue, at east end. Pruning and trellising of one year old Red Emperor, Cornichon, Tokay and Malaga varieties. 2 P. M., La Canada, at Kirst Bros.' vineyard (known as the Gould vineyard), located at the east corner of Gould Avenue and Michigan Boulevard. Pruning of old vines.

WALNUT INSTITUTE AT SANTA ANA

At a meeting of prominent walnut growers representing Santa Barbara, Ventura, Orange and Los Angeles Counties, December 15, plans were laid for the fourth annual walnut growers' institute at Santa Ana, January 13. The program includes report of walnut investigations of the citrus experiment station, discussion of the black sap disease of walnuts, better curing of walnuts before packing house delivery, subsoiling the orchard and establishing the young walnut orchard. It is expected that 800 or 1,000 walnut growers will be in attendance at this meeting judging from the attendance at previous institutes.

PRUNE PRICES ADVANCED

An advance of half a cent per pound in the price of the 1921 crop of prunes was announced by the California Prune and Apricot Growers' Association.

The following scale is now in effect among association members: 30-40, 10¼ cents; 40-50, 8¾ cents; 50-60, 7¼ cents; 60-70, 6¾ cents; 70-100, 6¼ cents.

MARCH OF APHYCUS

Inspector Bottel of the Los Angeles County horticulutral commission last week made an inspection of the district in Ventura County about the Limoneira orchards and reports a continuous heavy spread of the parasite in all directions. In a nearby apricot orchard formerly heavily infested with black scale this insect has effected a complete clean-up, the invading host being merely fugitives or emigrants from the Limoneira.

AID FOR PLANT BREEDER

Pursuant to plans outlined at the 54th convention of Fruit Growers and Farmers last October, Director Hecke has appointed the following committee to propose ways and means for the promotion of plant breeding work conducted independently for many years by Albert F. Etter of Humboldt County: Professor George P. Weldon, Chaffey Union High School; O. E. Bremner, county horticultural commissioner for Sonoma County; John F. Benton, county horticultural commissioner for Humboldt County.

Among the productions of Mr. Etter's life study are several strains of a hardy strawberry of excellent shipping and preserving qualities that should make it a commercial asset to California.

TREES

The Kirkman Nurseries is sending out a most attractive little pamphlet with lists of varieties of California fruit trees. Especially valuable is that section of the book devoted to figs. Mr. Kirkman suggests:

"No fruit is interesting California horticulturists more than the fig. Apparently it is only a problem of more efficient methods of preparation of the matured product to create a market demand calling for many times more figs than are now being produced.

"Most spectacular in its popularity is the recently introduced Kadota, which is the most sought for to supply the greatly increasing demand for preserved, pickled and canned figs.

"Mission is planted 30 to 40 feet apart, Adriatic and Calimyrna and Goodale 30 feet apart. Kadota and San Pedro are planted 20 to 30 feet apart usually, but it is recommended by some growers that they be planted even closer than 20 feet. The reason is that they start bearing early in life, and the tonnage is greatly increased during the first few years by planting more trees to the acre. Also, it is best to keep these varieties pruned back severely so that the crop be picked fresh, without the use of long stepladders. Some Kadota plantings are being made at 15 foot spaces. In those instances it is the plan to remove a portion of the trees in later years when they begin to crowd."

TIMBER SUPPLY NEEDS CARE

"The United States produces more than half of the entire lumber cut of the world," says Col. W. B. Greeley, chief of the forest service, "and uses 95 per cent of that amount at home. The exhaustion of our timber supply is coming about, not because we have used our forests freely, but because we have failed to use our timber growing land. The problem in a nutshell is the enormous area of forest land which has been so logged and burned that it is producing little or nothing. We have more than 80,000,000 acres, an area greater than all the forests of France, Belgium, Holland, Denmark, Germany, Switzerland, Spain and Portugal, which have been denuded to the point of absolute idleness so far as the production of any timber of commercial value is concerned. We have other enormous areas of cut-over land now growing but a fraction of the amount of timber which they might produce. And we are adding to these areas of idle or largely idle land from 10,000,000 to 15,000,000 acres every year as destructive logging and still more destructive burning progress."

KIRKMAN NURSERIES

Established in California in 1888

RELIABLE TREES AND VINES

are essential to the great fruit industries of the Pacific Coast.

Our experience has been gained by 32 years of progression in the nursery and orchard business in California.

Reservations are now being made for future deliveries.

We offer our services in undertaking the planting and care of commercial orchards on large scale.

Questions and Answers

Questions to be answered in this department should be received at the office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Pruning Pomegranates

Please publish particulars as to propagation from cuttings of pomegranate, also pruning of mature tree.—Subscriber, Calipatria.

Pomegranates are the easiest of all fruit trees to propagate from cuttings, comparable to willows. Any size of cuttings put in at time of greatest dormancy will readily root. The pruning consists of thinning so light can get into all parts of the interior. As fruits are heavy encourage branches having an upward and outward drooping tendency. As a rule pomegranates send up too many leaders. These may require reducing in number. Cut off under soil, close to stump or root.

Home Orchard

What trees would be best for a family orchard of half an acre? I want apples, apricots, peaches, pears, persimmons, guavas, nectarines and mulberries. Be sure and tell me a good mulberry, not Persian. I also wish the names of some good sweet cherries and also prunes and plums. There is a plum that looks like the Satsuma, but it's not so tart. What is it? Are feijoas and guavas the same fruit?—Subscriber, Burbank.

For general planting the correspondent is referred to a list carefully prepared by the Los Angeles County farm adviser's staff which appears elsewhere in this issue. Leading nurserymen of the South do not list mulberries among fruit trees, for they are generally considered of little value, even the best of them. In the northern part of the state dealers list, aside from the Persian, Downing's Everbearing, Lick's American, and New American. The plum that closely resembles the Satsuma is no doubt the Duarte, quite a family favorite in the South. The feijoa is one of the several species of guava commonly planted.

Olives in Bearing

Will you please tell me how soon after planting a young olive tree will it bear fruit.—Subscriber, Wasco.

The age of bearing trees depends upon so many different things that it is impossible to give very definite information. Of trees grown under apparently identical conditions one may not bear for many years while another, two years from cutting and planted in best of soil with best of tilth may arrive at bearing age in five or six years. As a general proposition it will probably be safe to count on ordinary orchard coming into bearing in about eight or ten years.

Citrus Soap

Answering inquiry as to use of soap in combination with Blackleaf 40:

This was submitted to Roy E. Campbell, entomologist of the U. S. department of agriculture, at Alhambra:

"In regard to citrus soap. If this is the powder, analysis just submitted to me shows the following: Moisture, 35 per cent; soap (dry), 21 per cent, and sal soda 43 per cent. The latter (soda) is of no value as a soap or spreader and may cause injury to green foliage. It can be used with Blackleaf 40 and with neutral lead arsenate, but should not be used with the acid type. In view of the fact that nearly half of this powder is sodium carbonate, it is much cheaper to use whale oil or fish oil soap which costs around five cents per pound. This sodium is further objectionable on account of its being black alkali. Soap and Blackleaf 40, plus neutral arsenate of lead, is the best remedy for the pests mentioned. Some good results have been obtained lately by using soap alone against the aphis, at the rate of eight to ten pounds per 100 gallons, but this is perhaps questionable to recommend until we are sure how much can be used without burning."

Avocados in Lime Soil

I read your (Dr. Snowden's) very interesting article on lime and liming in the Cultivator of some time since. I am growing avocado trees at Lemon Grove, San Diego County, on clay soil that is underlaid with marl. Where the marl is close to the surface the trees turn yellow and grow for a while and then die back. I sent a sample of soil to the University of California and they said it contained magnesium carbonate and lime, 60 per cent lime. What should I put on this soil to benefit the trees?—Subscriber, San Diego.

This question would have been answered personally had inquirer signed the letter. We are unable to locate him. Herewith is clipping from Dr. Snowden's letter. This is contrary to our rule, as it is not good form to attempt to answer an unsigned letter. Dr. Snowden writes:

"Your soil contains entirely too much lime and magnesia for agricultural use. It is doubtful if you can make anything grow successfully in a soil containing 60 per cent carbonates of lime and magnesia.

"While the avocado is a lime loving plant, it cannot tolerate so much lime. Organic matter that usually improves soil would be positively detrimental in this case, because it would render the lime and magnesia more soluble than they are.

"Just for the sake of experiment, suppose you try a pound of copperas scattered around one tree. It is barely possible this might help it, but do not experiment on more than one tree in this same way, for there is a possibility of it injuring the tree; yet I think the chances of benefit are greater than of injury."

Better Hit Trail for Tia Juana

What can they do to me if I am in with a bunch that drink moon shine whisty or make it and even if I don't drink it or help make I want to know and what is the find how long will they have to stayin jail.—Subscriber.

From reports touching upon the enforcement of the prohibition law we fear our inquirer is booked for an interesting time. We know that we were commanded by that most voluminous of writers in the New Testament: "Be not overcome with evil, but overcome evil with good," and therein is explanation of why our subscriber is mixing with "the bunch that drink moon shine whisty." But we must remind him that the same writer above quoted a litle later in life wrote an equally pungent sentence in, "Evil communications corrupt good manners." Therefore our guess would be that the manners might be so corrupted, at least in the eyes of the law, that it would be well to shun the evil companions. The court sentence may be a mild fine or it may be several years behind the bars. Fortunately our subscriber lives not far from Tia Juana.

Farm Bureau Dues

Is it legal for one county to charge more for county farm bureau dues than another county?—Subscriber, Fairmead.

It is hardly a question of legality. It must be borne in mind that the farm bureau is merely an association of farmers organized to support and make effective the work of the farm advisor or county agricultural agent. This being purely a voluntary act on the part of the farmers the amount of the dues is named according to their desires, and it varies from as low as one dollar per year to at least $10 in the different states, and this is divided between the local center, the county bureau and the national federation.

Legal Queries

Louis B. Stanton, attorney, 343 Wilcox Building, Los Angeles, will answer legal queries in this department.

Immediate mail replies cannot be given except where fee to Mr. Stanton is paid. When replies are wished in Cultivator address query to 317 Central Ave., Los Angeles.

Wife Responsible

The wife is the sole owner of property. She signs a petition. Can she be held legally responsible? Her husband does not sign. Since the time of signing she and her husband have changed their holdings to joint tenancy. Does this make any difference?—Subscriber, Ontario.

The separate property of the wife is liable for her own debts contracted before or after marriage. The wife certainly would be responsible for any action taken in signing any contract and her property held therefor, even though she subsequently caused the property to be held in joint tenancy.

Damage From Felled Tree

My neighbor fells eucalyptus tree on my land and damages my orange trees. Can he be required to pay damages?—Subscriber, Ontario.

He could certainly be held for damages and trespass and for the value of the trees and fruit thereon, which were destroyed.

Renting to Japanese

Is there any law which forbids the renting of land for cash rent to Japanese or other non-citizens? Is it legal to rent to Japanese or non-citizens on a crop share basis? Can a Japanese family be hired to work a garden or other crop and be paid monthly for their work? — Subscriber, Arroyo Grande.

The anti-alien law does not prohibit the renting of land to Japanese or any other aliens. The provision of this law is to the effect that in case such land is rented to an alien the state of California may bring an action in its own name to escheat the land on any interest which the alien acquires. As far as the contract between the lessor and lessee is concerned, it is entirely valid. It has recently been held by the federal court that a crop lease is not within the operation of the anti-alien law; that is to say, that in case of a crop lease to a Japanese, the state has no right to bring any action of escheat against the Japanese and can obain no relief thereunder. There is no law which prohibits in any way the hiring of Japanese to do labor where they are paid for their services.

Pasture Rent

A year ago a party pastured stock with me. I have notified him by letter to remove them twice. What steps must I take to collect my pasture bill?—Subscriber, Holmes.

Persons pasturing horses or stock are given a lien dependent on possession for such pasture. If the amount due for such pasturage is not paid within 20 days after it shall have become due, then the lien holder may proceed to sell the property at public auction by giving ten days previous notice of such sale by adverisement in a newspaper published within the

county within which the property is situated. The proceeds of the sale must be applied to the discharge of the lien, costs of keeping and selling the property, and the remainder, if any, paid over to the owner.

BUILDING UP SOILS VS. FEEDING CROPS

(Continued from Page 675.)

following winter while the dynamited trees escaped unharmed.

A plant food is any material which enters the plant body with benefit to the plant. It is a mistake to suppose potassium, phosphorus and nitrogen the only plant food elements, notwithstanding this has been long the prevailing custom.

A fertilizer is any material which when incorporated in the soil promotes fertility whether it is a plant food or not, though fertilizers nearly always do contain plant foods.

The foregoing table gives authentic average content of many common fertilizer materials.

To attain the ends in view deep plowing is desirable wherever practicable. An apparently barren cornfield in an Eastern state is known to have produced 12 bushels per acre without fertilizer after having been broken deeply and a subsoiler run still deeper in the bottom of the furrow.

The passage of water in "solid" sheet downward through the soil favors oxidation by drawing fresh air down after it. Then breaking up the packed surface after each rain or irrigation further favors oxidation. The growing of deep rooting cover crops with large root systems is beneficial in several ways. These root systems decaying in the soil depths carry humus far down and form vertical channels facilitating downward movement of air. Melilotus, both Indica (the yellow flowered) and alba (the white flowered) are good examples of this kind.

As to moisture requirement, the needs of some soils are greater than of others to maintain the same degree of efficiency, but a good practical test is to squeeze a sample of the soil in the hand; if it holds together in an easily crumpled lump it is suitably moist.

The addition of plant foods to the soil may be profitably limited to those that are deficient as shown by suitable chemical analysis. But even when certain ones are already plentiful in the soil these should be made available. Certain soils of the San Fernando Valley contain more than one per cent phosphoric acid. It is evident that additions of phosphates to such soils is sheer waste. Additions of finely ground lime carbonate to them are equivalent to adding phosphates. Likewise the soils of all Southern California are known to contain potash sufficient for many years' crops. Additions of nitrate of soda, or sometimes gypsum, are equivalent to adding potash, for these fertilizer materials are efficient in unlocking the native potash supplies.

In cases where a soil is invaded by destructive bacterial or fungous pests, or even small worms such as eel worms or nematodes it may be advantageous to destroy these even with destruction of the beneficial organisms. This can be effectively done by treating the soil with ferric sulphate (not copperas, which is ferrous sulphate). After this has been allowed to act for a few weeks it is easily destroyed by adequate additions of freshly slaked or quick lime, and then reinoculate with wholesome cultures of the desired organisms. This will leave the soil more fertile than before the treatment, even neglecting its improved biologic status. By following out the principles stated above any soil could be made productive of the crops suited to the particular climate.

Book Review

NUT GROWING

"Nut Growing," by Robert T. Morris, published by the Macmillan Company, New York, at $2.50.

This book touches upon seeds, soils, transplanting, grafting, hybrids, pruning and orchard care of nut trees in general. It is written from an Eastern viewpoint and touches first upon hickories then walnuts, hazels, chestnuts, pines, beechnuts, oaks and finally almonds. However, under walnuts appears: "California has taken the lead in walnut growing with a climate and soil particularly well adapted to the needs of the species." This is, of course, in that chapter of the book which has to do with the "Persian" walnut, the "Madeira" walnut, "Chile" walnut, "French" walnut, "English" walnut and numerous other names for Juglans regia. The California walnut, which we Californians like to term the "English" walnut or "Madeira nut," is a term used in the book only for Juglans californica, or the native black which grows over our hillsides. The author quotes largely from Carlyle Thorpe, manager of the California Walnut Growers Association, as to the magnitude of California's walnut industry. The Chinese nut, sinensis, is referred to as having a tendency to store up a surplus of the tannin and other bitter elements, thus making a nut of low grade, sometimes unpalatable. Almonds are dismissed with only three pages with practically no reference to culture but the author touches upon the history and importance of the commercial almond and the efficient work of the California Almond Growers Exchange. As may be noted from the preface of the book the author's idea is to so describe the various types of nuts that their commercial importance may be generally understood:

"Here is a book intended to serve as a general guide for leading the reader into a new field of agriculture. When the subject has captured the imagination of amateurs lust of the chase will do the rest. Many hands will make light work of research and experiment. Tree nuts are the only ones described and not many kinds of these—just enough to cover the principles and main points of nut growing. It is necessary to omit notes on hundreds of varieties and species of nut bearing trees and shrubs. Tropical nut trees bearing crops of nuts for which there is a large established market are interesting to people of the tropics, but this book does not go so far toward the equator. Nut bearing annual plants, including water plants which furnish a basic food supply for many people in distant countries, belong to a large volume not yet written."

1922 CATALOG

George C. Roeding of Fancher Creek Nurseries is out with his 1922 catalog. It is a beauty and as valuable as it is beautiful. It devotes several pages to methods of planting, care of and bringing to bearing various fruit trees. Of course primarily the catalog is given to descriptive and general hints as to values of various fruits and ornamentals. Here, for instance, is one of the valuable hints given in the text of the book:

"There are many things to consider before entering into the business of fruit growing. In these days fruit growing should be specialized. This does not mean that a man with his family living on his farm should not have a small home orchard, berries, vegetables, alfalfa, a cow, poultry and hogs. It is a fact that if more of our orchardists would give closer attention to these details they could not only operate their properties more economically, but derive much more pleasure than they now do from them.

"The preparation of the soil is practically the same for all sections of California. It is always a good plan when convenient to first cultivate the soil well and devote the land to the raising of alfalfa for three or four years, for alfalfa will redeem soil very much more quickly than it can be built up in any other way. The land should be carefully plowed and the roots cleared out before planting trees. This can best be accomplished by thorough plowing, followed up by harrowing until the soil is friable. This work should be done in the fall and early winter months before the rains set in if possible. Sub-soiling is essential to any well developed land as it loosens the earth and leaves it in a condition that will permit deep penetration of the roots.

"Where irrigation must be practiced, grading must be done so that all spots will be accessible from laterals running from the main ditch, and should there be any low spot where the water is likely to stand too close to the surface, drainage should be carefully considered."

FIGHT PINK BOLLWORM

The conference called by the federal horticultural board of the United States department of agriculture on account of the recent discovery of the pink bollworm in Ellis and Grayson Counties, Texas, and held at Dallas, December 2 and 3, brought together the important interests related to cotton from Texas, and official and other representatives from other cotton states. The conference developed an absolute unanimity of opinion that every measure should be taken for the extermination of the pink bollworm pest in Texas and other Southern states. Unqualified assurances of support in all measures necessary were given by the spokesman of each of the Texas delegations and by representative growers from the newly infested counties.

Supervisors of Alameda County have formally protested to the railroad commission against granting further permits for stage or truck lines within the county. Damage to roads is reason alleged.

The Cultivator Patterns

3749. Ladies' Dress. Cut in 7 sizes: 34, 36, 38, 40, 42, 44 and 46 inches bust measure. A 38 inch size requires 5⅞ yards of 44 inch material. The width of the foundation skirt is 2¼ yards. Price, 10 cents.

3496. Girl's Dress. Cut in 4 sizes: 8, 10, 12 and 14 years. A 12 year size will require 2⅝ yards for the middy and 3¼ yards of 27 inch material for the skirt, collar and cuffs. Price, 10 cents.

3807. Ladies' House Dress. Cut in 6 sizes: 34, 36, 38, 40, 42 and 44 inches bust measure. Size 38 will require 5¼ yards of the 36 inch material. The width of the skirt at the foot is 1⅞ yards. Price, 10 cents.

3787. Two Attractive Overblouse Models. Cut in 7 sizes: 34, 36, 38, 40, 42, 44 and 46 inches bust measure. A 38 inch size requires 2¼ yards of 36 inch material. Price, 10 cents.

3760-3757. A Smart Costume. Blouse 3760 cut in 6 sizes: 34, 36, 38, 40, 42 and 44 inches bust measure. Skirt 3757 cut in 8 sizes: 24, 26, 28, 30, 32, 34, 36 and 38 inches waist measure. To make the costume as illustrated will require 2¾ yards of striped material and 2⅞ yards of plain material 42 inches wide. The width of the skirt at the foot is about 2⅛ yards. Two separate patterns, 10 cents for each pattern.

3786. Girl's Dress. Cut in 4 sizes: 6, 8, 10 and 12 years. An 8 year size requires 3⅝ yards of 42 inch material. Price, 10 cents.

3235. An Attractive Apron. Cut in 4 sizes: Small, 32-34; medium, 36-38; large, 40-42; extra large, 44-46 inches bust measure. A medium size will require 4½ yards of 27 inch material without the sash. Price, 10 cents.

3795. Ladies' Skirt. Cut in 7 sizes: 24, 26, 28, 30, 32, 34 and 36 inches waist measure. A 28 inch size requires 2⅝ yards of 42 inch material. The width at the foot is 2 yards. Price, 10 cents.

PRICE OF ANY OF THE ABOVE PATTERNS 10 CENTS EACH

HOW TO ORDER PATTERNS

Write your name and address plainly in full, give correct number and size of each pattern you want, and send 10 cents in coin or (1 or 2 cents) stamps for each number. In order to furnish our readers with the very best NEW YORK styles, all patterns ordered are filled in NEW YORK. Do not expect patterns under **Two Weeks** from date of order.

CATALOGUE NOTICE

Send 15c in silver or stamps for our Up To Date Fall and Winter 1921 Catalogue, containing over 500 designs of Ladies', Misses' and Children's Patterns, a concise and comprehensive article on dressmaking, also some points for the needle (illustrating 30 of the various simple stitches) all valuable to the home dressmaker.

THE YEAR AND THE DAYS

The year is a general riding by,
A general stout and tall,
And little it matters how hard we try,
We cannot keep step at all.
No matter how eager and spry, 'tis clear,
We cannot keep pace with the mighty Year!

But, ah, there's a company called the Days,
The merry and brave and wise;
They march to the music that duty plays,
Whatever the changing skies,
And no one need stumble, and none need fall,
And we may keep step with them, comrades all!

Make ready!—Salute!—as the great New Year
Rides by to the roll of drums;
And then fall in line with a soldier's cheer,
For each little day that comes.
The Days are like children that come and go—
The year can take care of himself, you know!

—Frank Walcott Hutt.

A NEW YEAR'S CARD

Now what is here?
A word of cheer
To herald in another year;
May all its days be free of blame—
A little nobler than your aim;
May all its labors be confest
A little better than your best,
And all the joys within its scope
A little brighter than your hope;
And may each year be found, when past,
A little dearer than the last.
—Arthur Guiterman in Woman's Home Companion for January.

The glad bells are ringing and hearts, be ye singing;
The world still is wide, and lo, heaven bends o'er!
The past is behind us; its griefs shall not bind us,
The way still is open; the goal is before.
New Year, let us greet you; we're happy to meet you;
We're glad for the chance that you give us to strive.
With naught of regretting, past sorrows forgetting,
We'll be happy today and be glad we're alive!

MY NEIGHBOR AND LEMONS

By Annette Squire

YESTERDAY morning the neighbor that I'm never sorry to see came into my kitchen just as I was putting "the grated rind and juice of one lemon" into a sunshine colored concoction, and "stirring it well."

"Is that," she demanded, "all that you do with your lemons? Put them into frivolous things like that just to make your man and kiddies grin? Listen to me, nice friend; a real, live, plump lemon can be made good use of in at least a dozen ways besides mere flavoring."

"Indeed!" said I. "A dozen! Prove your contention. Enumerate the wise ways in which you use lemons."

"Agreed," said she, "but I'll not be in the least offended if you try, later on, to see if a taste of that will make me grin. What is it?"

"Fluffy orange marmalade lemon pie!"

"Oh! Um! Well, I still say that you could have used that lemon in a dozen other ways. I squeeze lemon juice on the drainboard of my sink to whiten it; I take out ink stains with it; I put it in my wash boiler to bleach my clothes; I use it for my chief cosmetic. A little juice squeezed in a basin of water takes the shine off this elegant nose of mine, acts as a gentle astringent on my nice smile wrinkles, and keeps the whole of my distinguished and unique face two shades whiter than otherwise it would be. And lemon it is in the rinse for my shampoo that puts the shine and the fluffiness into this hair of mine! As for my hands, when they are manicured, lemon softens the cuticle and bleaches the nails and obliterates the needle pricks and the paring knife cuts. Surely you have used it to take stains off your fingers?"

"Of course," said I, popping up from the oven. "Go on. That's only eight or nine uses. And you've used a lot of your words to praise yourself. You must work harder than that for your grin."

"Oh, I merely paused to ascertain whether you ever used it for anything besides cooking. I use it, diluted, as a tooth wash. It is antiseptic, you know. Some of the nature sanitariums are using it for wounds and bed sores. Of course, you know it has cured many a sore throat. When the children have one of those long, spasmodic coughing spells at night I feed them lemon juice in hot water, slowly, a spoonful or a swallow at a time. If the cough is bad I add a very small pinch of cayenne pepper. The lemon soothes the irritation; the warmth and the cayenne relax the larynx, and we all go back peacefully to sleep.

"I suppose you've heard how ships, even as far back as the middle ages, carried regular rations of lemons, or limes, as they called them, though they were really a kind of lemon, to keep the sailors free from scurvy? And you know how they used lemons in the late war? Why, they even gave the soldiers in the trenches lemon drops!"

"Candy!" I exclaimed. "How nice of them!"

"For medicinal purposes," she said severely, but quirking the corners of her mouth. "It is estimated that if everyone would use one ounce of lemon juice daily the doctors would no longer be bothered with all those doleful rheumatic and gouty and hyperacid patients."

"All right," I said, as she took a little breath. "That pie came out lovely. Now go on to the vitamines."

"Vitamines! Don't get me started talking with such scientific words! I might feel called to go on talking to you about the potassium in lemons—food lime, you know. No mineral is more needed in the building and repairing of the body . And there's the malic acid—that's what does you good in apples. And, my dear, did you know that they give lemon now in fever cases? They use the juice of one lemon to a quart of water and add two or three ounces of malt sugar; and very sick patients usually are benefited by drinking this, even to two quarts a day. But I'd rather take my vitamines and citric acid and potassium and malic acid as a preventive, when I am quite well and can enjoy—well, something like that delectable stuff you have there."

"This?" I cried. "Why, this is merely flavored with lemon—and with orange! We like those flavors."

"They are appetizers," agreed my neighbor, squaring herself to the table by the sunlit window, "they stimulate the flow of saliva and of the gastric juice."

"When you use lemon juice instead of vinegar in your salads you mean," I offered, "or when you put a slice in your cup of tea, or serve it with fish or chicken."

"I mean when you use it in pie," she declared with emphasis.

"You admit then that this lemon is not wasted?"

"Admit it! Gracious! I haven't time for that! Give me some! The very look of it is ravishing!"

I set the white and golden concoction before her. It really looked very nice. It was like the sunshine of our valley with the snow of our mountains drifted across it.

She tasted. She grinned. "That is good," she said. "Just how do you make it? I think I could feed Jim and the boys quite a little extra of the antiscorbutic vitamines in this easy to take shape! I have an idea they wouldn't object at all!"

She flashed me her merriest smile.

It is good to have lemon in the diet. It is also good to have a neighbor that you are never sorry to see. For it is true that "a merry heart doeth good like medicine."

HINTS FROM HOUSEKEEPERS

For Convenience and Economy

While we value the Cultivator highly as a weekly visitor in our home, I will confess to the habit of turning to the household department the first thing to see what new hint or recipe there is that I can make use of. I am glad to learn new and helpful things about housekeeping and home making, and I thought that perhaps a few hints that I've found good might be of use to others.

When scalding a chicken the feathers come off more easily and the bird is more readily cleaned when a teaspoon of baking soda is put into the scalding water.

Flour for gravies is more quickly stirred smooth if warm water is used.

The idea of using colored tea towels may at first shock the fastidious housewife. Try having at least one towel on the rack of worn gingham or voile or any soft weave goods and see how satisfactory it is and how easily kept clean.

Outing flannel pillow cases for cold weather on the sleeping porch are very comfortable. The least worn parts of old blankets can be made into pillow slips that will wear for several months.—Mrs. H. M. L., San Jacinto.

Says Sam: One fellow I never could understand is the "100 per cent American" who calls his home town a "hole."

New Lamp Burns 94% Air

Beats Electric or Gas

A new oil lamp that gives an amazingly brilliant, soft, white light, even better than gas or electricity, has been tested by the U. S. Government and 35 leading universities and found to be superior to 10 ordinary oil lamps. It burns without odor, smoke or noise—no pumping up, is simple, clean, safe. Burns 94% air and 6% common kerosene (coal-oil).

The inventor, V. S. Johnson, 31 N. Fifth St., Portland, Ore., is offering to send a lamp on 10 days' FREE trial, or even to give one FREE to the first user in each locality who will help him introduce it. Write him today for full particulars. Also ask him to explain how you can get the agency, and without experience or money make $250 to $500 per month.

DELICATE GIRLS

Many who are inclined to over-thinness, or anemia and dread winter's cold, should take

Scott's Emulsion

and keep on taking it and realize how effectually it warms and strengthens the body and helps make winter enjoyable.

HOUSEHOLD QUERIES

Hominy

Please print in your household department recipe for making hominy. Would like some recipes for cooking also.—Subscriber, San Fernando.

Dissolve 2 ounces soda lye (2 tablespoons, level) in gallon water in agateware pot. Place white dry corn in this and boil hard for 1 hour. Place corn in wire basket or mosquito net bag and let cold water run through it for 5 or 6 hours. If this cannot be done place in large tub of water and change water often and stir frequently for 6 or 8 hours. This is to remove the lye. Rub thoroughly between hands to remove hulls or hulls also may be removed by revolving in barrel churn. When hulls and eyes are removed place hulled corn back in agateware kettle with water and cook until tender. Place on coarse screen and wash out remaining hulls and eyes. This will not keep long unless canned. Fill into cans, add boiling brine of 2 ounces (2 tablespoons) salt per gallon water. Sterilize cans in pressure cooker 45 minutes at 15 pounds pressure 250 degrees Fahrenheit, or boil 1½ hours on each of three successive days.

Hominy Souffle.—Mix 1½ cups hominy with yolks 2 eggs, 1 cup milk, ½ teaspoon salt, 1 tablespoon melted butter. Cut and fold in the whites beaten stiff, pour into buttered baking dish, set in pan of hot water and bake until firm, about 30 minutes.

ENGLISH FRUIT CAKE

One pound butter, 1 pound light brown sugar, 9 eggs, 1 pound flour, 2 teaspoons mace, 2 teaspoons cinnamon, 1 teaspoon soda, 2 tablespoons milk, 3 pounds currants, 2 pounds raisins, seeded and finely chopped, ½ pound almonds, blanched and shredded, 1 pound citron, thinly sliced and cut into strips. Cream the butter, add sugar gradually and beat thoroughly. Separate yolks from whites of eggs; beat yolks until thick and lemon colored, whites until stiff and dry, and add to first mixture. Then add milk, fruit, nuts and flour mixed and sifted with mace, cinnamon and soda. Put in buttered deep pans, cover with buttered paper, steam three hours, and bake one and one-half hours in a very slow oven, or bake four hours in a very slow oven. The steaming makes the cake more satisfactory and the baking brings out the richness of flavor.

SEEKERS AFTER GRACE

Wife—"Did you notice the chinchilla coat on the woman sitting in front of us at church this morning?"

Huband—"Er—no. Afraid I was dozing most of the time."

Wife—"Um. A lot of good the service did you."—Chicago Tribune.

Satisfactory home electric light plants can be operated with the same engine you use on the cream separator. Be sure, however, that your engine is not given to "cutting out"—which causes lights to flicker.

There's two kinds of people always in hard luck; them th't did it, but never thought; and them th't thought, but never did it.—Josh Wise.

Josh Billings once said: "It ain't so much ignorance that does harm as their knowing so darned much that ain't true."

Selfishness does not always apply to the man who is unwilling to share his belongings with others, but it also applies to the man who may have some practical ideas and will not pass them on to his neighbor.

The home water supply system is easily arranged by having an air compressor on supply tank, both easily operated by a 2-H. P. gas engine. A small feed mill can be arranged to utilize the same power.

Which?

Would you have a rosy, flower strewn way,
With the calls of peace and rest each day,
All friends and love, and a sky that's bright?
Ah, remember the day leads to the night!

No! tackle the doubt, make friends with pain—
And never mind if there's sun or rain;
Rise by the stumbling blocks in your way,
And remember—the night leads to the day. —Edith McKay.

HOW TO CLEAN PLUMES

Use large china bowl which is perfectly dry. Pour in 1 pint gasoline and wash feathers in this to remove worst of dirt. Empty and wipe the bowl dry, then pour in another pint gasoline and mix two tablespoons wheat flour. Stir until a thin paste is formed. Lay feather in paste and wash from stem out by rubbing with ends of your fingers. Do not rub back and forth as this ruffles flues. Squeeze gasoline out by drawing feather through closed hand. Shake in air until almost dry and roll feather in cornstarch. This does not remove the curl from feathers as does washing in soap and water. Feathers and plumes cleaned by this method can be made to look like new.

A WET WEATHER BAG

A cretonne sewing bag is a thing of beauty and a joy forever when Old Sol is smiling, but when Jupiter Pluvius is master of ceremonies it fails to keep the sewing materials dry, not to mention the face powder, and we all know the importance of "keep the powder dry." The point is that a bag made of a leather substitute having a waterproof coating, makes a better wet weather sewing bag than cretonne. While it doesn't come in flowered designs it may be had in many shades and colors.

MORBID CURIOSITY

After all our plans to obtain public trials of offenders against the law, it is ironical that this publicity should be misused. A Chicago judge is so exas-

> "There are two kinds of success, one that of rare genius and the other that of the ordinary man who does ordinary things a little better than his fellows." —Theodore Roosevelt.

perated with the idle "sightseers" in his court room that he locked up 32 of them for two hours and threatened them with "twenty days" if they came back to look on any more.

Making an entertainment of the misfortnunes of others is a sign either of a low grade of mental development or of shocking bad manners. One hesitates to say that it is also a sign of a cold heart, though such is probably the truth.

The rule of decency in a case of moral disaster involving the victim in a court trial is exactly the rule of decency in case of a physical injury. A well bred person finds out whether there is anything he can do to help or relieve suffering. If there is, he lends a hand. If there is not, he goes along and minds his own business and does not hang around to watch the body lifted into the ambulance.

The morbid curiosity which peers at a wounded body or at a wounded soul is one of the least lovely traits in humankind. It is a clear indication of something unwholesome in the disposition so given, and the trait probably dates back to the genealogical origins of hoofs and tails—not to mention long ears—which it is the main business of human self-discipline to eradicate.

If we feel ourselves given to curiosity of this sort it is time to call a halt. —Boston Globe.

SUITABLE PHRASING

Appropriately enough, the sounds that come through the door labeled "Voice Cultivated" are usually harrowing.—Pittsburgh Sun.

100 Per Cent Efficient

The farmer's humble assistant in action. Photo by F. A. Monro, Covina.

PREPARATION OF VINEGAR

The University of California has recently reprinted a bulletin giving the complete directions for the preparation of vinegar from cull fruits. The conversion of cull apples, pears, grapes, oranges and other fruits containing moderate amounts of sugar offers a profitable means of utilizing such material. The bulletin, which was prepared by W. V. Cruess, is No. 287 of the University of California Experiment Station. It will be sent on request to College of Agriculture, Berkeley, California.

PUT BABY IN A PIE TIN

When mother is busy around the kitchen and baby (too young to walk or crawl but fond of "sliding") becomes eager to be on the move, try putting her in your largest pie tin and let her slide on the floor to her heart's content without getting dirty.

CAN'T FOOL 'EM

Two negroes were engaged in conversation when one of them became very much annoyed by the persistent attention of a large fly.

"Sam, whut kin' a fly am dis?"

"Dat am a hoss fly."

"Whut am a hoss fly?"

"A hoss fly am a fly whut buzzes 'round cows an' hosses an' jackasses——"

"You ain't makin' out for to call me no jackass?"

'No, I ain't makin' out for to call you no jackass, but you can't fool dem hoss flies."—Forbes Magazine.

THE ONLY ONE HE KNEW

"Could I sell you Boswell's 'Life of Johnson,' sir?" asked the book agent.

"Certainly not," replied the self made millionaire. "I'm not interested in the careers of colored pugilists."—Birmingham Age-Herald.

DOMESTIC T. N. T.

"You must not let your wife get so excited."

"Goodness gracious, doctor, if I tried to stop her from getting excited she'd get so excited she'd raise the roof."

COURAGE

The brave man is not he who feels no fear,
But he whose noble soul its fear subdues,
And bravely dares the danger nature shrinks from. —Joanna Baillie.

NO SYMPTOMS

"Who is the mysterious stranger?"

"Some kind of an investigator."

"Working for the government?"

"I doubt it. He keeps pretty busy."—Detroit Free Press.

A detour is the roughest possible distance between two points.—Syracuse Herald.

You can also judge a man by the records he keeps on the phonograph.—Rochester Times Union.

Modern novels give us glimpses of almost everything in the world except good grammar.—Indianapolis Star.

Want to Hear from owner having farm for sale, give particulars and lowest price. John J. Black, 116th Street, Chippewa Falls, Wisconsin.

Wanted—400 Splendor prune trees on Peach or Myro root. M. Sharpe, Vacaville, California.

FRUITS, NUTS, ETC., FOR THE SOUTH

The following planting list is recommended for Southern California in general by Farm Adviser Hodgson of Los Angeles County, who says it was prepared by members of his staff after a careful survey of local orchards and vineyards:

Apples — Red Astrachan, Winter Banana, White Winter Pearmain, Arkansas Beauty, Rhode Island Green, Yellow Bellflower, Jonathan, Delicious and Newtown Pippin.

Apricots—Royal.

Avocados — Puebla, Fuerte, Sharpless, Spinks, Taft.

Cherries—Royal Ann (Napoleon Bigareau), Black Tartarian, Bing.

Figs — Kadota, Brunswick, Black Mission, Black San Pedro, Calimyrna.

Grapes — Eastern. California Concord (Pierce or Isabella Regina), Niagara; European. Emperor, Malaga, Thompson Seedless, Tokay, Muscat.

Lemons—Eureka, Lisbon, Villa Franca.

Loquats—Advance, Champagne, Premier, Thales.

Nectarines—Advance, Stanwick.

Oranges—Washington Navel, Valencia, Satsuma, Paper Rind St. Michael.

Olives—Mission, Manzanillo, Ascolano, Sevillano.

Peaches—Alexander, George 4th, Elberta, Foster, Hale, Phillip Cling, Tuscan Cling, Salway.

Pears—Bartlett, Comice, Winter Nelis.

Plums—Satsuma, Burbank, Wickson, Santa Rosa, Climax, Duarte.

Prunes—French, Imperial, Sugar.

Persimmons — Hachiya, Tanenashi, Hyakume, Tsuru, Tamopan.

Pomegranates — Wonderful, Paper Shell, Sweet Fruited.

Pomelos—Marsh Seedless.

Walnuts—Eureka, Placentia Perfection, Ehrhardt.

Give a Thought to Livestock in '22

By R. P. Royce

WITH 1922 just around the corner, a good many California ranchers find themselves at the crossroads of their operations. They have pulled through 1921 considerably the worse for wear and, while downright glad that the year is over, they are looking forward to 1922 with an anxiety that tinges their hopes for a more prosperous season with a bit of doubt justified by their recent experiences. For many the consoling thought is that at the worst the new year cannot be more disastrous than the one just closing. In short, they have plumbed the depths and know the worst and feel that any change must be for the better. There seems to be plenty of evidence to support such belief. In general economists and big business men seem fairly well agreed that the bottom, so far as agricultural staples are concerned, has been touched—that the corner has been turned. Gradually, but certainly, financial and business interests that took the lead in price deflation primarily directed toward agriculture and apparently expected to succeed in making the American farmer stand the brunt of such process while they themselves held to their war time profits, are finding that after all agriculture is the goose that lays the eggs of gold and that only as agriculture prospers can other activities show life. The new year can bring about but two conditions: Either agricultural values must go up or other values come down to a level of the farmer's purchasing power. In either case, the result, so far as agriculture is concerned, is the same and the producer wins whichever way the cards are cut.

But out of the chaotic state agriculture is in at the present time, one fact seems to stand out and that fact is this: From now forward agriculture must be developed along sounder principles than have obtained in the past few years. And in the process of rehabilitating the industry it is certain that livestock of some sort will occupy an important role. This because of the fundamental importance of animal husbandry in any permanent scheme of agriculture, and particularly because the beginning of 1922 finds California short of livestock of all kinds.

That such a shortage is a fact in this state is common knowledge to all observers and is indicated by the further fact for the past year trainloads of hogs and many cars of cattle have been shipped into California to supply the needs of local killers. It is not a particularly satisfying fact that in a state boasting of 117,000 farms, and natural conditions for livestock production unexcelled, we have to go as far east as Kansas City for hogs, while our own markets have averaged two to three and a half cents higher than cornbelt quotations.

The only reasonable explanation of such a situation is the failure of California ranchers to appreciate, in a more general way, the real possibilities of livestock production. Indeed, it can be definitely stated that one of the weakest features of California agricultural practices is the lack of a sound livestock policy in operations of the average rancher. Far too long our farmers and ranchers have leaned toward specialization. Specialization is all right in some cases but year in and year out the man who developes his production along broader lines will be found in a stronger position than his specializing neighbors. The year 1921 has demonstrated that fact to be true. Go into the alfalfa and barley sections and what do you hear? Bitter complaint over existing prices and the lack of buyers. Barley men declare that the 1921 crop was produced at a loss and there is no question but that is true; yet for the most of the year barley fed to hogs would return the grower around $2 per hundred — a price double what many men received. The same complaint is heard from alfalfa districts — yet men who had cows and hogs have made a profit. Go throughout this state and study the lessons made plain during this year. Aside from cerain fruit growers, what men in the average community have weathered the storm in the easiest fashion? In the majority of cases it has been the men with some sort of livestock. The same is true in other states. As a matter of fact, with mighty few exceptions, it has always been easier for the man with livestock, because, first of all, through maintaining livestock and feeding part or all of his crops, the fertility of his land has been kept up or increased, thus enabling him to produce crops at lower cost. Again the growing of livestock invariably brings added income to the business through the utilization of much forage that otherwise would be lost and it is seldom that feed of all kinds, where fed under good practice, will fail to show a margin above the primary price.

The need for a more general livestock program on the part of California ranchers was never more pressing than at the present time, nor has a more favorable set of circumstances faced the man who desires to grow livestock.

There is the established necessity of many men changing their plans of operation; a real shortage of nearly all sorts of livestock in California—particularly hogs and cattle; more satisfactory markets than we have been accustomed to; an oversupply of cheap feed and values for breeding stock at rock bottom.

It is not here suggested or urged that one enter the business on an extensive scale or with a great outlay of capital. It is not even urged that one start with only pure bred stock—although it is urged that in buying the matter of quality should govern the purchase. But the plea is made for more of our readers to make a move toward getting some sort of livestock and that the start be made in 1922.

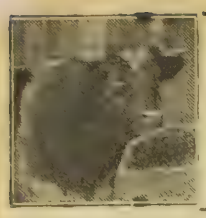
California farmers need have no hesitancy in approaching the livestock business in a small way. By starting moderately, the initial investment need not be large and by conservative management it is surprising how soon a herd or flock will develop. Many of the leading herds in this and other states have been developed from a small foundation. Indeed it is under such a plan that the business returns the greatest profit. Time is an essential of animal husbandry and nine times out of ten it is the man who has been content to develop a herd from a modest beginning who reaps the greatest profit, rather than the speculator and plunger who expects to garner an unholy profit in a year or two.

Livestock offers no easy way to extreme wealth but it does offer a mighty sure and safe road to a good living and a competence and many a farm mortgage born in 1921 will be paid off with milk checks and pork and cattle sales.

If you, Mr. Reader, feel that you are standing at the crossroads and view the new year with apprehension, it might not be a bad idea to seriously look into the livestock business. Perhaps your barley and alfalfa can be marketed through cattle or hogs to a better advantage. In the end, most of your hay and grain will be bought by men who will feed it and the profits they will make could be kept at home.

The Cultivator doesn't recommend livestock as a universal panacea for all of our agricultural troubles, but we do prescribe livestock as a mighty sure relief for the cramps affecting a lot of bank rolls caused by too much "cash crop" farming.

Long distance Holstein records are being broken in California with great regularity at present. With the 305 day milk record already broken by a heifer in Fred Hartsook's herd at Lankershim, and a senior yearling headed for the junior two year old record in the same herd, with a Bridgford heifer finishing with around 27,000 pounds in 365 days as a senior two year old, and Earl Graham's junior three year old finishing up with right around 30,000 pounds, the honors are being distributed around in fine shape.



The Farmer's Chance

In a shipment of fifty panhandle, long, three and four year old steers marketed at St. Joseph, Mo., Oct. 3, were two grade Shorthorns owned by A. Hancke, Council Grove, Kan., out of ordinary milk cows. The panhandle steers netted $52 per head, the grade Shorthorns $105.75—$5.70 for the panhandlers and $7.50 for the Shorthorn grades. Better use a Shorthorn bull.

Preference in Cattle Breeds

By A. L. Spellmeyer

THE ideal double purpose cow for dairy and beef use has not yet been developed. From the many breeds men select those they consider best for their particular grass or climate, and this varies in different localities.

The Shorthorn or Durham leads in the United States over the Hereford by a very small percentage, with the Holstein and Jersey following in the order mentioned.

The Hereford is a comparatively modern breed, just about as old as this country. It was a development of a blend made in Herefordshire, England, and originally started with frame and weight rather than color as the intention. It is probable many breeds had a part in the development of the Hereford, including the rugged stock from the Scottish moors, the large framed animals from France, the cattle of the Picts, and even the Holstein-Friesian. The early Herefords were spotted and did not carry the red with white face of today in solid colors, but were gradually evolved to breed true to the present type. Some of our patriots of the Revolution made the first importation into the U. S. A., I believe either Jefferson or Hamilton, and these cattle were spotted, with a good part white. An ancestor of mine named Marshall and another named Roberts were among the first prominent breeders who made the Hereford a definite breed through selection of types, so that I can't be blamed for keeping to a business that is as unprofitable as the present one of cattle.

The Holstein, or Holstein-Friesian, was originally mostly a red and white breed with some black and whites, and gradually it has been evolved to a definite form. It was started in a country of small farms for milk yield and has developed wonderfully in the last few years. The United States, and especially Washington and California, have made great progress with Holsteins until they are far better today here than the original breed is in Holland or any part of Europe. A large, rugged, heavy type of Holstein is being developed in parts of this country that may finally with a cross develop during the coming generation into an almost ideal double utility breed if a line can be developed that will fatten and has a will to forage on grass.

Although the Holstein here is tending to heavier production of meat pounds, the ordinary Milking Shorthorn or Durham has fallen off in general milk producing qualities and rather tends toward a beef breed exclusively. The Hereford is strictly a beef breed and is a great rustler on scant forage and stands adverse climate. The Herefords of this country since Anxiety have tended toward smoothness and shape rather than great bone, and the ideal Hereford here and in England is gradually diverging in type. The packers are responsible for this, as they desire smoothness and cuts more than weight and we find this same weight and bone versus smoothness idea bringing up arguments in swine.

In this country different states concentrate on different breeds of cattle. New England runs to Holsteins, with Jersey the second breed and Ayrshire third. Rhode Island runs strong to Holstein with three times as many Ayrshires as Jerseys. Iowa runs strong to Durhams, with Herefords second and Aberdeen-Angus third, with few dairy cattle. Wyoming and Montana run very strong to Herefords, as also New Mexico and Arizona, and most of the West, Nevada, Idaho and Oregon, run rather to Durhams.

California prefers Holsteins, with Durhams a second, Herefords a third and Jerseys a fourth. More than one-third of California cattle bear the Holstein impress although the cattle numbers of the state are not supposed to total over one-fourth dairy stock and three-fourths beef breeds. The information of the department of agriculture does not always bear itself out as in this instance of California cattle numbers, and my long repeated contention has been that the number of beef cattle is overestimated.

For California we have the following breed percentages (Year Book, 1921): Holsteins 37, Durhams (Shorthorns) 24.2, Herefords 15, Jerseys 12.4, other dairy breeds 4.4, other beef breeds 2, and balance mixed.

California (Year Book, 1921) is supposed to have 577,000 dairy cattle and 1,683,000 other cattle. On the face of it the breed percentages are probably the most accurate as compiled from dairy stock kept in close control and subject to full report. If this is true, counting Durhams as beef rather than double purpose or milking stock, California would have about 54 per cent dairy cattle stock.

With higher land values California's future lies in cattle, in increasing dairy numbers and the growing of registered breeding supply of beef cattle, as the range is becoming too high priced for ordinary beef production in many localities already, unless these beef are extra good in grade and we have good rains.

The beef supply of this state is inadequate now for slaughter demands. Our men are quitting the raising of cattle for the pasturing and growing of steers imported from other states, and we face a tremendously expanding beef demand, with the coming world development and world food demand in the great Pacific. Whatever breed is selected, if they are good registered stock and the producer has the money to carry on and build up during this low price period, he will do well later. There is coming to this Pacific shore a development that the entire world, France, England and New York now recognizes, and there will be a great demand from Mexico to the Argentine and from Siberia to China for registered stock when we settle down again .

Eventually we are going to concentrate on dairy cattle and registered beef cattle, for cattle must have lower expense in production of actual bulk beef or double present prices. Mexico has a tremendous potential productive power, as well as South America, where costs would be a tithe of ours in land investment, labor and expense. The great plains of Mongolia and many parts of Siberia are wonderful cattle country where animals can be raised at small cost. It is far cheaper to transport the meat than raise it here. All this will not come in a day, but it will come. The great packers have foreseen this trend by establishing tremendous abattoirs in South America, and this even explains their apparent indifference to whether the range cattle industry of this country lives or dies as in the future we are going to raise our milk, make our cheese and import a big part of our meat.

NAPA SHEEP WIN AT PORTLAND

The Ratto Stock Farm of Ratto Station has just brought back its flock of registered Shropshire sheep from the Portland Livestock Show, where they made a wonderful showing against large eastern and northern competition. The following premiums were awarded them: Second in age ewe, second in ram lamb, third on pen bred by exhibitor. At the California International Livestock Show held in San Francisco, they were also placed with high honors. The Ratto Bros. are well pleased with the showing made by their sheep, especially considering that they were not fitted for the show circuit, but simply separated from the rest of the flock one week before the San Francisco show.

LOS ANGELES COUNTY COWS NOVEMBER RECORD

The report of the Los Angeles County farm bureau cow testing association for November shows some very good records. During the month there were 3,400 cows tested, producing an average of 875 pounds of milk and 34.7 pounds of fat per cow. Practically 33 per cent of the cows in the association are producing more than 40 pounds of fat per month. A Los Angeles County cow owned by Burr Farms was the high cow of all associations, producing 127 pounds of fat for the month of October.

Livestock News Notes

At the recent dispersal sale of the famous Landwater stud of Clydesdales, O. H. Brant of Shellville secured the three year old stallion Dunure Refiner, for which he paid $1,600. Dunure Refiner is a son of the noted Scottish sire Dunure Footprint and is reported to have cost $16,000 in Scotland a year ago. The bringing of this young stud to California means that breeders of this state will have available the most popular and highest priced blood lines of the breed.

While East this month Howard Vaughn of Mountain View Farm, Dixon, attended the Loveland Shorthorn dispersal sale and selected the imported cow Marchioness 9th, as well as two heifers, Clara Maid 5th and Corelli 7th.

Alex Wilson, manager of the Italian Vineyard Company's herd of Berkshires, is feeling mighty pleased over the fact that Guasti's Leader's Champion, a boar bred by his firm, topped the recent Berkshire sale at Chicago when he sold for $425. The general average of the sale was $89.

California figured prominently in the Chicago Hereford sale when a representative of William R. Hearst topped the sale by paying $6,250 for the junior yearling bull, Good Donald 37th. This bull was sired by Good Donald 23d and stood third in class at the International. Six of the better females were also secured for the Hearst ranch in San Luis Obispo County. Good Donald 37th is the highest priced Hereford bull to come to California.

K. S. P. J. Pet Segis, the grand champion show daughter of King Segis Pontiac Jannek, recently freshened as a senior three year old at Maxwell Farms, Hollywood, and has now completed an official record of 31.57 pounds butter from 578.9 pounds milk in seven days, being the first 30 pound daughter of her young sire. It will be remembered that this great heifer fetched $3,600 in the James J. Jeffries sale last February, while her dam topped the females at $4,500.

Guernsey enthusiasts are going to have another rare opportunity to buy registered breeding females at public sale in California, as C. S. Rasmussen, the well known dairyman and breeder of Loleta, has decided to make a public sale offering. Everyone who follows dairy production records in California is well aware of the wonderful showing Mr. Rasmussen's herd has made in the Humboldt County Cow Testing Association, of which it has been a member since 1909. Last year the entire milking herd of 143 head averaged 371 pounds butterfat. In the coming sale Mr. Rasmussen will sell the entire middle section out of his registered herd; that is, he will retain only the oldest cows and the 1921 heifer calves. In addition to the registered cattle there will be a limited number of very high grade Guernsey cows offered so that practically every female in the herd is either milking or well along with calf. Probably not more than two or three bulls will be offered, among them one of the herd sires, Proud King of Edgemoor, a wonderfully bred bull, his sire being the famous Imp. Itchen May King, formerly owned by W. H. Dupee, and his dam, Proud Dame, with 719.86 pounds butterfat from 14,602.9 pounds milk in one year, she a daughter of the noted bull Ne Plus Ultra. He is a bull of excellent type, was second prize winner as a yearling at California State Fair, and among his get are first prize winners at the National Dairy Show and other prominent eastern shows. For the convenience of buyers Mr. Rasmussen has decided to sell these cattle at Rhoades & Rhoades' Sale Pavilion, Hynes. The event will be managed by California Breeders Sales and Pedigree Company, Sacramento, and will be held Thursday, March 2.

Excellent progress is being made with preliminary work for the sale of registered Herefords under auspices of Pacific Coast Hereford Cattle Breeders Association to be held at University Farm, Davis, during Stockmen's Week, the last week in February. California Breeders Sales and Pedigree Company, Sacramento, which will manage the sale, reports that consignments of more than half the required number of cattle have already been offered and that a closing date for entries will soon be announced.

Aralia De Kol Mead 2d recently dropped a pair of twin heifer calves by Sir Aaggie De Kol Acme in the A. W. Morris & Sons herd at Woodland. The seven nearest dams of these two heifers average over 1,100 pounds butter in one year, making five heifers in the Morris herd with an average of over 1,100 pounds for the seven nearest dams, a number not possessed by any other breeder in the world. Unless study has been made of many of the greatest yearly pedigrees of the breed it is difficult to realize how few matings are possible to produce calves with such tremendous backing for the seven nearest dams, and to find five of them in one herd is indeed remarkable. Aralia De Kol Mead 2d is now on test and promises to better her former seven day record of over 32 pounds butter.

J. L. Sebastian, Wasco, has the honor of developing the first 30 pound cow in Kern County, and the record is noteworthy in several respects. The record was made by the senior four year old, Zampa Aurelia Segis Pontiac, with 30.23 pounds butter from 730.1 pounds milk in seven days, and 123 pounds butter from 3,032.1 pounds milk in 30 days. She comes honestly by her great production, being sired by Segis Pontiac De Kol Crane, formerly at the head of Walter Mitchell's herd at Visalia, he by Segis Pontiac De Kol Burke, son of Riverside Sadie De Kol Burke, former world's record yearly milk producer. Her dam, Zampa Aurelia of Packwood Farm, is a daughter of Candida of Sleepy Hollow, the wonderful old cow that made a world's record production for age just this year, when she made 23.30 pounds butter from 604.3 pounds milk in seven days, milking over 90 pounds in one day at past 16 years of age, and she by a son of Colantha 4th, dam of the famous former world's record cow, Colantha 4th's Johanna. Mr. Sebastian has collected a very choice herd of modest size, and is just beginning official test work. His herd is headed by the richly bred young sire, Sir Aaggie De Kol Mead 2d, son of Sir Aaggie De Kol Mead and Miss Dutch 2d, having an average of 1,043.26 pounds butter from 23,311.2 pounds milk in one year for six of his seven nearest dams.

There have been 1,164 carloads of fat cattle shown at the International Livestock Exposition in the 20 shows held since the International was inaugurated in 1900 — 472 loads of Aberdeen-Angus, 455 loads of Herefords and 237 loads of Shorthorns.

Manager Cash of Sierra Vista Ranch writes: "At the completion of the fall fair circuit which ended with us at Portland we found we had been awarded 159 ribbons, seven medals, a cup and $1,300, and had traveled 3,500 miles. Not bad for a concern only two years in business? We have set the date of February 16 for our bred sow sale, and expect to offer at that time about 35 head of bred sows and gilts. We shall hold the sale rain or

TRAVIS B. MINGS
HOLSTEIN DISPERSAL
65 Registered Cows and Heifers
El Monte, Calif. Thursday, January 5, at 10 A.M.

Fay Tritomia Hengerveld, a 30 lb. daughter of Mutual Fobes Longfield De Kol, selling heavy with calf to a richly bred son of Sir Pietertje Ormsby Mercedes.

Marion Hengerveld Pontiac, out of Fay Tritomia Hengerveld, the 30 lb. cow shown at left, and sired by the $12,000 bull, King Korndyke Pontiac 20th.

In the face of a strong demand for registered Holsteins there is almost the assured fact that fewer of these cattle will be offered for sale in California during 1922 than for any of the past five years. Buyers will therefore use good judgment in attending the early sales of the year.

Mr. Mings is dispersing an excellent herd, rated on breeding, type, production, and the attractive physical condition in which they will be offered.

Every animal is guaranteed a breeder, every one over six months old tuberculin tested and sold subject to retest by the buyer.

The sale managers, California Breeders Sales and Pedigree Co., will extend the usual liberal terms of one-third cash, balance in 3, 6 and 9 months to responsible parties who arrange for credit before sale.

Among some of the good ones in the sale are:

Four daughters of the $12,000 bull, King Korndyke Pontiac 20th.

Four granddaughters of the four times grand champion Bridgford bull, King Segis Alcartra Prilly, sired by one of his 30 lb. sons, a full brother to the junior champion at the 1920 California National.

Five granddaughters of Maid Tuebie Segis, the great cow that made 1,140 lbs. butter from 28,383 lbs. milk in one year.

Several daughters of King Segis Pontiac Jannek, the grand champion in this year's Southern California shows.

Over twenty cows and heifers with official records up to over 30 lbs. butter in 7 days.

A granddaughter of Adirondac Wietske Dairy Maid, whose 41 lb. record is the largest ever made on the Pacific Coast.

The sale will be held on Mr. Mings' farm, two miles south of El Monte, under cover, rain or shine.

RHOADES & RHOADES will be the Auctioneers.

Applications for catalogs or credit should be addressed to the Sale Managers. California Breeders Sales and Pedigree Co. 211-212 Ochsner Bldg., Sacramento, Calif.

Sir Aaggie DeKol Mead

Bred in the richest Aaggie Acme-De Kol of Valley Mead cross, he should be one of the greatest young sires of the breed.

Five of his seven nearest dams average:

Butter	2 Years	2,040.97 Pounds
Milk	2 Years	41,547.20 Pounds
Butter	1 Year	1,130.66 Pounds
Milk	1 Year	23,096.60 Pounds

His seven nearest dams average:

Butter	7 Days	30.47 Pounds
Milk	7 Days	627.60 Pounds

His calves are just what we could expect from a long succession of great sires and dams, and in their present state of development fulfill every promise in the pedigree of their great sire.

Good business judgment will eventually prompt you to place at the head of your herd a bull of Aaggie Acme-De Kol of Valley Mead breeding.

POTATOES AND ONIONS

These are the actual prices obtained between 7 and 8 o'clock, December 27, by wholesalers in their sales to retailers, peddlers, hotels, restaurants, cafeterias, etc. Terms: Cash on walk. There may be slight fluctuations during the day's trading.
Potatoes: Movement moderate, market firm. Lugs mostly 90@1.00. Stocktons: Burbanks, per cwt., best, special brands, 2.50@2.75; others, 2.25@2.50. Idahos: Russets, best, 2.25@2.50; Rurals, mostly 1.90@2.10; bakers, 3.00. Locals: White Rose, 2.00@2.25. Sweet potatoes: Market firm. Locals: No. 1, best, 1.00@1.25 per lug; per cwt., No. 1, 2.75@3.00; No. 2, 1.50@1.75.
Onions: Demand moderate, market firm. Stocktons: Per cwt., White Globes, best, cold storage stock, mostly 7.00@7.25; poorer, 6.50@6.75; browns, best, 5.00@5.50; poorer, 4.75; per lug, whites, best, 2.00@2.25; poorer, 1.85; browns, 1.50@1.75; poorer, 1.35. Spanish sweets, best, mostly 6.25@6.50 per cwt. Green: 20 bunch.
Garlic: Lb., 9@11.

VEGETABLES

These are the actual prices obtained between 7 and 8 o'clock, December 27, by wholesalers in their sales to retailers, peddlers, hotels, restaurants, cafeterias, etc. Terms: Cash on the walk.
Artichokes: Doz., 1.60@1.75.
Beans: Movement slow. Flats, 16@20; limas, 16@20 per lb.
Bunched vegetables: Per doz. bunches: Turnips, 30@40; carrots, 50@60; radishes, 20@30; parsley, 15; spinach, 25@35; beets, mostly 50@60.
Cabbage: Market steady. Per field crate, mostly 2.75@3.00; poorer, 2.25@2.50.
Cauliflower: Market weak. Best, mostly 2.00@2.25; poorer, 1.50@1.75.
Celery: Local, per cr., mostly 3.25@3.50; few, 3.75; poorer, 3.00.
Cucumbers: Market steady. Carlsbad, 1.60@1.75 per flat. San Diegos: Best, 3.00@3.25; few 3.50.
Eggplant: 8@10 lb.
Lettuce: Demand moderate, market weak. Locals: Field crates, best, 1.00@1.25; poorer, 75@90.
Parsnips: Lug, 85.
Oyster plant: 60 doz. bunches.
Peas: Market firm. Local, best, 22@25; poorer, 18@20.
Peppers: Locals: Bells, green, per lb., 17@18; chili, mostly 16@18.
Rhubarb: Best, 1.00@1.10.
Squash and pumpkins: Market steady, movement moderate. Banana, 1@1¼ lb.; Hubbard, best, 1¼@1½; mostly 1¼; cream, 2; Italian, 1.40@1.50 lug, 1.00 per flat. Pumpkins: 1@1½ lb.
Sweet anise: 60 doz.
Tomatoes: Market steady. Locals: No. 1, per lug, best, mostly 3.00@3.25; few 3.50; poorer, 2.00@2.50, according to size and quality. San Diegos: Per 4 basket crate, best, 1.75@2.00; poorer, 1.25@1.50.

FRESH FRUITS

Apples: Demand and movement moderate, market steady. Locals: Romes and King Davids, 5@6; few best Delicious, Yucaipa section, 6@8 lb. Watsonville: Fancy, 3½ and 4 tier, Bellefleurs, 1.60@1.75; poorer, 1.50; 4½ tier, 1.40@1.50; B grade, 4 tier, 1.40@1.50; loose, per lb., 3½@4. Idahos, Washingtons and Oregons: Jonathans, extra fancy medium to large sizes, 3.00@3.50; fancy, 2.85@3.00. Oregons: Spitzenburgs, medium to large, extra fancy, mostly 2.75@3.00; fancy, 2.50@2.75.
Avocados: 50 lb.
Cranberries: Market steady. Massachusetts: Late Howes, 25.00@27.00 bbl.; New Jersey, Late Howes, 27.00@28.00 bbl. Oregon: 22.50@23.00.
Dates: Coachella, 25@26.
Grapes: Demand moderate, market steady. Per lb.: Red Emperors, 14@16.
Pears: Anjous, per lb., 8@9; Bartletts, 4@5; few 6.
Persimmons: Lb., 12@14.
Pineapples: 20 lb.

CITRUS FRUITS

Grapefruit: Market steady. Californias, northern: Packed, box, 3.00@3.50; small, 2.50; Imperial Valley, 5.00@5.25. Arizonas: Seedless, 4.00@5.00, according to size and quality.
Lemons: Demand and movement slow, market weak. Locals: Special pack, mostly 3.75@4.00; market pack, 2.50@2.75; loose boxes, 1.50@1.75; poorer, 1.00.
Oranges: Demand moderate, market steady. Navels, special brands, 216s to 126s, fancy, 5.25@5.75; choice, 4.00@5.00; orchard run, 4.00@4.25. Valencias, market pack, 3.00@4.50, according to size and quality. All varieties culls, field boxes, 2.00@2.50; poorer, 1.50. Tangerines: Demand and movement moderate; best, 9@10.

HONEY

The general situation shows little change over that prevailing two weeks ago. Stocks continue to decrease and are much lighter than were those at the corresponding period last year. Demand is reported as light. Due to light supplies, the market, although quiet, has a healthy tone. Alfalfa honey is in heavier supply than white honey. Quotations per pound in carlots or less than carlot quantities, f. o. b. California points: White orange blossom, nominally 12@12½; white sage, 11@12; light amber sage, 8½; light amber alfalfa, 6½@6¾. Growers are said to be asking 10@13 per pound for white orange blossom and 6½@7 for light amber alfalfa. Beeswax is in fair local demand at present at 20@25, mostly 22 per lb. to the beekeepers by bee supply houses for use in making next season's foundations. Demand in the East is lacking, as imported wax offers too great competition.

HAY

Alfalfa Growers of California report:
The rains interfered with business. Track arrivals could not be moved until near the end of the week and then only in part, while country loadings of new shipments were stopped almost completely. New loadings will probably continue light for some time.
There were 1,200 tons of grain and alfalfa hay received on the Los Angeles tracks the week ending December 24, with 540 tons held over.
Prevailing prices last week, delivered in the vicinity of Los Angeles:

No. 1 dairy alfalfa	24.00
Standard	19.50

Quotations by Nichols-Loomis Company. Following are prices to growers f. o. b. Los Angeles in carload lots; handling and commission must be added to obtain retail prices on new hay:

Tame Oats	22.00@28.00
Barley	18.00@24.00
Alfalfa, Rabbit	24.00@28.00
Alfalfa, No. 1 Dairy	20.00@22.00
Standard	16.00@18.00
Straw	10.00

HAY AND FEED

California Alfalfa Growers report:
Prevailing prices last week, f. o. b. San Francisco:

No. 1 dairy alfalfa	19.00
Standard	16.00

A. W. Scott Co. says:
Receipts past week, 776 tons as compared with 522 previous week. Market has been steady, trade fairly active. Low grades have been doing better. Local trade quiet but export and coastwise heavier. Interior trading more active. Continued cold, dry weather has forced feeding in almost all sections and the demand has greatly increased chiefly for stock and dairy hay of all kinds. Alfalfa is most active.
We quote today wholesale prices in carload lots as appear from dealers' transfers upon the markets in San Francisco (for prices to consumers, charges of switching, cartage, commission and handling expenses must be added, according to conditions).

Wheat hay No. 1	17.00@19.00
Wheat hay, fair grade	14.00@17.00
Tame oat hay	15.00@18.00
Wild oat hay	11.00@13.00
Alfalfa hay	13.00@16.00
Stock hay	9.00@12.00
Straw	10.00@12.00
Rolled Barley	29.00@30.00
Ground Barley	31.00@33.00
Oats, Rolled Feed	34.00@36.00
Bran and Millrun	25.00@28.00
Middlings	41.00@44.00
Coconut Meal	23.00@26.00
Alfalfa Meal	21.00@23.00
Cottonseed Meal	40.00@42.00
Sugar Beet Pulp	27.00@29.00
Molasses Tanks	21.00 Barr. 25.00
Milo Maize	31.00@40.00
Cornmeal and Cracked Corn	38.00@41.00
Scratch Feed	40.00@43.00

GRAIN

Sales on Grain Exchange:
Barley: Feed, 1.25@1.30; shipping, 1.30@1.45.
Wheat: Mill, 1.85@1.95; feed, 1.85@1.95.
Red Feed Oats: 1.55@1.60; seed, 1.75@2.10.
Corn: California yellow, 1.45@1.50; eastern yellow No. 2, 1.37@1.40; No. 3, 1.36@1.38; No. 3 kaffir, in bulk, 1.43@1.45; white Egyptian, 1.72½@1.77½; California red milo, 1.42½@1.45.

Citrus Markets

Los Angeles, December 28, 1921.

After Christmas sales are holding up exceptionally well and prices realized are generally satisfactory. The Southern oranges are not yet fully colored and the weather has prevented picking. It will probably be a couple of weeks before packing houses get into full swing.
The lemon market is very satisfactory with but few foreigns in sight.

Shipments

Shipments of citrus fruits to date since November 1, 1921, Southern California:

Oranges, 1,126 cars; lemons, 801; total, 1,927. To same date last season: Oranges, 1,135; lemons, 675; total, 1,810. From Central California to date this season: Oranges, 3,821; lemons, 27; total, 3,848. To same date last season: Oranges, 3,449; lemons, 29; total, 3,478. From Northern California to date this season: Oranges. 345; lemons, 3; total, 348. To same date last season: Oranges, 276; lemons, 2; total, 278.

The Route Taken by Feed in Stomach of Cow

The correct routes food take in passing through the four stomachs are indicated by arrows. Route 1 commences at the mouth, if the ration has bulk, it expands the gullet and also the slip in gullet No. 6 and drops into stomach No. 1. Later it returns through the same slit to the mouth for rechewing. This second chewing is a thorough grinding between the teeth and every particle is saturated with saliva until of soup-like consistency, is then swallowed, but this soup-like mass does not expand gullet and therefore passed by the slit in gullet No. 6 and takes final or route No. 2.

INCREASED EFFICIENCY THROUGH GRINDING OF FEED

(Continued from Page 671.)

takes both routes of the digestive system. That makes cattle thrifty.

"Cut and ground corn stover meal is superior to cottonseed hulls and equal to timothy hay. Ground roughage meal prepared from alfalfa, clover, soybean or cowpea hay is equal in feeding value to bran, and worth the same as bran, ton for ton. Roughage meal prepared from cane, sweet sorghum, milo, kaffir or feterita fodders is maintenance ration for beef cattle. Cattle fed only silage crave dry roughage meal, as it counteracts the effects silage has on the digestive system and on the gums. Brood sows require ground legume roughage meal. Ground roughage meal is high in ash, a bone builder.

"The old world feeders for centuries have mixed grains with cut straw and hay. Ground roughage acts as a distributor of the grains. Roughage carries the grain with it into the first stomach of the cow and then later it is regurgitated and then passed into the third stomach and hence takes the proper route through the digestive system, assuring a thorough digestion, making animals thrifty, keeping them in high state of health and condition. Cattle once accustomed to mixed roughage meal no longer prefer ground grains unless mixed with roughage. This fact proves that such preparation is correct.

"The time saved in handling, weighing and measuring alone pays for cutting and grinding, and again in preparing bedding and keeping the manure free from stalks, practically offsets the time and expense of grinding.

"You can make all of your own mixed feed at home by proper planting of crops. You eliminate the purchase of all mixed feeds at a continuous big saving.

"Besides, such feed is fresh, unadulterated, free from mill litter, oat hulls and trash. Transportation cost in the mixed feed bill alone makes the purchase of mixed feeds unprofitable and inadvisable. Feeders who are looking for more profit will prepare their own mixed feed at home. Summing up these advantages, it pays and pays big to manufacture your own mixed feed right at home.

"Roughage meal is in a most convenient form for daily feeding in a uniform manner without waste, as it is usually handled, weighed or mixed. A ton of loose hay occupies about 500 cubic feet of space. Baled hay about 220 cubic feet. Roughage meal requires only 90 cubic feet, therefore is easily stored and if shipped twice as much weight can be loaded per car. Manure from roughage meal is handled easily by carrier or spreader and soil gets immediate fertility, whereas, stalks and stems deteriorate slowly. Roughage meal is in just the right form for use in self feeders.

"Feed and water are the only two sources of milk and butter fat. Unless cows are well fed they cannot produce. When so fed cows will often respond in a manner that may amaze you.

"Variety tends to reduce the cost of the ration, to increase palatability and increase digestibility. Palatability produces a more efficient use of the feed consumed because it stimulates a far greater secretion of the digestive juices. Bulk performs the mechanical function that properly guides all the feed into the first stomach of the cow to be later regurgitated and then take the second route through the digesive system. Again, bulk keeps the feed loose and spongy in the digestive organs so that the digestive fluids can easily penetrate to and act upon every part.

"Alfalfa, cowpea, soybean or clover hay ground into a meal will replace wheat bran as a conditioner. These roughage meals are rich in lime, the principal ash of bones. This ash is largely lacking in bran. The Alabama experiment station effected a saving of 23 per cent in cost of ration by substituting cowpea hay meal for wheat bran. Feeds if possible should be grown on the farm. Leguminous hays, such as alfalfa, clover, soybean or cowpea hay are the best and cheapest source of protein. In addition to their value as food stuff, they greatly improve the soil and crop yields.

"Ground roughage meal and silage work together. Silage is succulent and palatable but not balanced. Feeding dry ground fodder with silage keeps the animals in condition and counteracts all bad effects of silage upon the digestive system. Feeding dry ground fodder prevents overfeeding silage.

"A ground roughage meal from alfalfa, soybean or cowpea hay mixed with ground concentrates can be used to supplement pasture for high producing cows. Such cows will decline in milk flow to a marked extent unless the additional food is furnished them.

"Remember the dairy cow serves you from 12 to 15 years in the dairy. Her production and long life depend to a great extent upon the protection you give her digestive system. She converts from 100 to 200 tons of feeding stuff into milk and butterfat during her lifetime and should not be required to soak and predigest grain for hogs. Only with the proper care and feed can she produce to the greatness of her ability. Poorly nourished cows give birth to weak, puny calves that are hard to raise. Well fed cows give birth to well developed, strong and sturdy calves. Give the cows a chance. With high priced land and declining profits it often is the means of converting loss into profits. They have earned two extra profits, one from increased production, the other from cutting the feed bill by using roughage meal and ground grain."

LIVESTOCK NEWS NOTES

(Continued from Page 685.)

shine and shall have a large tent in case the weather is bad. The sows will be bred to such boars as Pathfinder's Pride, Winsor's Defender and Royal I Am, the latter undefeated grand champion of California."

Aralia De Kol Mead 2nd, after dropping twin heifer calves that have an average of over 1100 pounds butter in one year for their seven nearest dams in the A. W. Morris & Sons Corporation herd, Woodland, was placed on official test and in her first seven days has to her credit 36.53 pounds butter from 607.9 pounds milk and promises to show an increase. She thus becomes the highest record daughter of Segis Pontiac De Kol Burke. She is also the dam of the sensational heifer, Miss Aralia De Kol Mead, sold in the St. Paul National sale to Brentwood Farms, Philadelphia, but now owned by Fred Hartsook, Lankershim. She is also out of the same dam as Sir Aaggie Mead, the $9,250.00 bull owned by W. J. Higdon, Tulare, and F. S. Borror & Son, Tipton. Her last year's calf, a bull that is full brother to the twin heifers dropped this year, is now in service in the University Farm herd at Davis.

RELATION OF THE HONEY BEE TO DECIDUOUS FRUIT PRODUCTION

(Continued from Page 673)

many varieties of fruits, and are very helpful with nearly all others. Among the fruits which are benefited by bees are almonds, apples, cherries, pears, plums and prunes. Shy bearing in almonds, for a long time attributed to cold weather and similar causes is largely due to lack of cross pollination. In Bulletin 306 of the University of California, Professor Tufts has shown that all varieties of almonds are self sterile. He recommends interplanting proper varieties and the use of one colony of bees per acre. In bulletin 307 he makes the same recommendation for pears. In various parts of the United States apples have been greatly aided in setting crop with bees because so many varieties of the fruit are self sterile. Likewise, cherry varieties as shown by work in Oregon, Idaho and California are all self sterile. The writer has observed many demonstrations of the value of bees in cherry orchards where the crop was formerly almost nil. Japanese plums are likewise self sterile with but few exceptions and are in great need of effective cross pollination. The same is true of most European plums. Among prunes two well known varieties are self sterile and two are self fertile. The results as reported in Bulletin 294 of the California experiment station show that the Imperial prune, long notorious as a shy bearer, is wonderfully benefited by bees and even the French prune, long known as a consistent bearer, is caused to produce larger crops by these same insects. In other sections bees are helpful in producing different crops. It is reported that cranberry yields are greatly increased by the use of bees and the importance of the same insects in growing tomatoes and cucumbers under glass is well known.

On the other hand apricots according to some observers are pollinated with their own pollen before or soon after the blossom opens. It is also known that they are self fertile and able to set fruit with their own pollen. Whether bees would aid this fruit or not is a question that has not been answered as yet. The same situation exists with many varieties of peaches. The flower is so constructed that self pollination may take place easily. The writer has also observed that the peach flowers are very attractive to bees and are visited by them in great numbers. What effect the work of bees may have on this fruit is not known, but most certainly there seems little cause for worry as great plantings of a single variety of this fruit are known to produce regularly and abundantly.

The importance of the element of time as previously mentioned in pollination of flowers cannot be overestimated. Distribution of pollen for a given variety must be made in a very few days. If delayed, lack of set may result for reasons already explained. It is in this case where the bee is especially valuable. Other insects might succeed in visiting every flower if given time enough, but the bees due to their untiring efforts seem to accomplish this work in the shortest possible time. The consequent mixing and distribution of pollen as soon as the pistil is ready to receive it is the thing that makes for big production. Large numbers of bees are needed in cloudy or wet and rainy seasons where every hour of sunshine counts.

Preference Shown by Bees

Bees have preference for particular varieties, possibly the same as you and I have. Some kinds are accepted until others open, when the former are deserted. There is not much data on this point and it is of more concern to the grower than to the beekeeper. It has been reported that in some sections bees have been observed to desert cherries for apples. In my own experience I have observed that early Japanese plums are not visited as frequently as the later varieties. For example, Formosa and Gaviota are both shunned when the European kinds begin to open. Scanty production of pollen and honey in these two varieties may be the cause. Bees are said to work satisfactorily on strawberries and are especially fond of raspberries. In California because of their long blooming season the latter fruits are of considerable value as honey plants.

Some growers have their own bees but most prefer to rent for the season. The rental is usually made with the understanding that the owner is to place the bees where desired and to remove them promptly after blossoming season in order not to interfere with other orchard operations. The best method of distribution is to place the hives singly throughout the orchard. This method insures a more even set of fruit than is the case where 10 or 20 colonies are all put in one place. It is also well to put the hives near the center of the orchard so the bees will work near at home as much as possible. The average grower is not altruistic to the extent of paying for an increase in his neighbor's crop. Ordinarily about one hive to the acre should be sufficient although excellent results have been obtained when less were used.

Increased Yield Due to Bees

Noticeable increases in yield have invariably followed the use of bees. What these increases are in actual figures is hard to secure. The average grower knows he harvested a larger crop than he did before and that is about all. One or two examples, however, will suffice. In 1916 one grower with 180 acres of prunes produced 344 tons of dried fruit. The following year when 115 colonies of bees were used the crop was 432 tons, an increase of nearly 100 tons. Another grower on seven acres of cherries with 17 tons in 1918 raised his yield to 52 tons in 1920 and to 49 tons in 1921 by the use of ten colonies. Other growers have undoubtedly had similar experiences elsewhere.

Quality of Cross Fertilized Fruit

With most of stone fruits there is no outward sign showing whether the fruit has been properly fertilized or not. If the fruit matures and ripens it is usually considered to have been fertilized although no one ever thinks of cracking the pit to see if the kernel is developed or not. In our experiments plums which were self pollinated by hand showed no difference in size, shape or quality from those cross pollinated. The plant breeder would be interested in determining how seeds would germinate and grow from the various combinations. The grower, however, is satisfied when the fruit remains on the tree to maturity. With apples and pears the case is somewhat different. Instead of one pistil to each flower there are five. All five must be pollinated and the respective eggs fertilized to secure a perfect fruit. Very often due to lack of pollination, only three of the five carpels or divisions in the core of the apple have perfect seeds while the other two have not. The fully developed portion of the fruit corresponds with the side having the perfect seeds. The Cornell experiment station has shown a direct relation between the number of seeds in an apple and the percentage of June drop. This drop always consists of the fruits having the smallest number of seeds. In other words, the larger the number of seeds the better the chances for that fruit to remain on the tree until mature.

In California where Barlett pears are grown extensively a great portion of the fruit is found to be practically seedless and coreless. For reasons as yet unexplained this pear under our conditions is seemingly able to set and mature fruit whether it contains seeds or not. The seedless quality of this variety, it is argued, constitutes a distinct advantage as the core is much smaller and the flesh is not so gritty. These factors are advantageous to the canner and grower where the product is consumed soon after picking. In the demand for a long keeping pear, however, some interesting points have been developed in this connection. The University of California has recently shown that the Barlett pear with perfect seeds keeps from two to three weeks or more longer than the seedless ones picked at the same time. The advantage of cross pollination for producing a long keeping pear is obvious.

Injury Caused by Bees

The average grower in general has two grievances against the bee. One is the attacking and injuring ripe fruit on the trees and in the dry yard and the other is in the spread of certain diseases, notably pear blight. Usually the sight of several bees gathered around a split or puncture in a ripe fruit is enough to cause the grower to want to rid the entire country side of these obnoxious visitors. The benefits received during the blossoming season a few months previous are entirely forgotten. It has been demonstrated that bees are not the primary cause of injured fruit. The first damage is usually done by birds or insects which have piercing mouth parts. The honey bee comes along later and gets the blame. Actually the damage, if any, started by bees is so slight as to be practically negligible.

With pear blight the case against the honey bee is somewhat stronger. Experiments have shown that bees do carry blight and that the blight organism remains alive in the hives for several weeks after it has been brought there. However, to my knowledge it has never been definitely proved that bees prefer the sticky exudate of the blight canker to the honey in the blossom when the latter is available. It may be that the blight organism is picked up accidentally and thus transferred to the blossoms. Because of its size the honey bee seems to be the most frequent visitor to pear trees, and hence is judged guilty of doing all of the harm. As a matter of fact other insects such as thrips, aphis, ants and beetles of various kinds are as guilty as the bee. If they were not, how is blight in young twigs and on young trees without blossoms explained? The solution to this difficulty is to use more care in removing old holdover cankers which form sources of infection. The honey bee must be given credit for performing so faithfully the function of distributing pollen, and should be relieved of the stigma of being the chief carrier of blight and general nuisance at harvest time.

Book Review

FARM BUREAU MOVEMENT

"The Farm Bureau Movement," by Orville Merton, with introduction by President Howard of the American Farm Bureau, published by the Macmillan Company, New York, at $2.00.

This is an excellent presentation of the history of the beginnings and of the present powerful position occupied by the farm bureau. It is written in a spirit entirely friendly to the movement and the tone of it may be appreciated from this sentence picked at random in the middle of the book: "And let me repeat, the combining of time and of effort, of capital and of commodity — cooperatively — in 'c-o-o-p-e-r-a-t-i-o-n' — not 'corporation,' is not alone our privilege—it is our right."

In President Howard's introduction we note: "The consumer is apparently torn between the hope that organized agriculture will mean more economical marketing and the fear that it may mean monopoly, with resulting high prices. The manufacturer and the merchant are wondering whether the movement means for them bigger markets or restricted activity. The politician is frankly alarmed at what he calls the solidarity of voting strength which he sees looming ahead."

The book is not largely illustrated though there are a few plates mostly of portraits. There are nearly 300 pages in the 22 chapters making up the book. These chapters touch upon the "Background," giving the beginnings and early organization efforts, and at some length upon farm bureau aims, a frank discussion of the strength and weakness of the organization and finally ends with a discussion of "The Farm Bureau a Force in National Affairs."

A few years ago farmers said a gas tractor would not do for threshing, it could not be depended upon, an old steam engine was all that could do the work. If one wanted to find a steam engine today he would have a hard time finding one at work, and if it was located it would be an old one. Practically all the threshing, silo filling, feed grinding and power units are run by gasoline or kerosene tractors.

10,000 DOZEN EGGS FROM 600 HENS

(Continued from Page 673.)

third week it was before them all the time. Overfeeding of mash is believed by both Mr. Wylie and Mr. Holloway to be the most frequent cause of coccidiosis, hence the care with which it is used at first.

No nursery mash was used, the chicks being put on a growing mash at the start and kept on it till they were three and a half to four months of age. At this time, when combs were well developed, and a few eggs dropped, the growing mash was removed and the pullets were put on a maintenance mash of bran and bone meal, as recommended by the poultry division of the state university. This maintenance mash was kept before them till about the end of the sixth month, when the change to laying mash was begun by putting laying mash on top of the maintenance mash in the hoppers. The pullets quickly ate through the laying mash to the bran underneath, thus automatically diluting their own mash. By this time many were laying, and between the sixth and the seventh month all got down to work. The grain mixture is changed from time to time, but has consisted for the most part of wheat, milo and barley. About one and a half ounces are allowed each hen daily.

Greens are an important part of the ration of both chicks and hens. The chicks are started on cut alfalfa, chard and lettuce, and alfalfa, cut green barley and slabs of spineless cactus form the green ration of the hens. On his five acres Mr. Wylie raises practically all the greens for his flock of 1,200, besides allowing large yards which can be planted to barley from time to time, and room for fruit trees.

Damp Yards for Dusting

Droppings boards are cleaned and disinfected with carbolineum every other day. Once a week the droppings in the runs are raked up and the runs wet with the hose. This moist dirt in the yards gives the hens a good place for dusting and saves the labor of using louse powders.

A Big Hatchery

After leaving the Wylie place the party made a visit of inspection to the Holly Hatchery, where 28,000 eggs were already in the big incubators and new incubators being installed to increase the capacity of the plant from 140,000 to 200.000.

An air washer has just been installed which will cool and clean all the air which passes into the hatching rooms. A cooling space between the double walls of these rooms, with carefully arranged air shafts, insures an even temperature, no matter what the weather may be, and the ventilation is so perfect that the air is changed every 15 minutes. The incubators are heated by natural gas and no egg of a greater age than nine days is ever set. By this careful attention to details Mr. Holloway is able to hatch 75 per cent of the fertile eggs in his incubators.

Most of the eggs incubated in the hatchery are bought from the big breeders of San Gabriel and Van Nuys, but a few are provided by the thousand odd hens on the Holly ranch, where the houses, although 12 years old, still conform to the plan generally adopted for the San Fernando Valley, a long house with sections 16 or 18 by 20, and boarded up four feet from the floor in front to keep out drafts. A board awning in front keeps out sun and rain and can be adjusted at will. The green feed hopper used in these houses conforms to the plan worked out by Messrs. Gordon and Burgess for the Pomona laying contest, and consists of wire through which the hens peck at the alfalfa, with a sort of wooden drawer below. Both wire and drawer just fit under the droppings board and may be drawn out for refilling.

In the hatching rooms great stress is laid on the frequent and thorough turning of the eggs. Slatted trays are used and the eggs, which lie for convenience with the small end down, are turned with a jerk of the wrist of the attendant. Clear eggs and dead germs are tested out by electricity, and the live germs which remain are exercised by moving from place to place on the tray in order to make sure that all receive the same amount of heat.

The end of a perfect day for the 20 odd guests on this occasion was the annual banquet of the Van Nuys chamber of commerce, of which Mr. Holloway is president.

LEGBANDS FOR POULTRY

The most satisfactory means for identifying individual birds belonging to either the backyard poultryman or the owner of a farm flock is the numbered legband.

Every fall an increasing number of poultry raisers are culling their flocks to eliminate the boarder hens. By this process the best producers are retained and become the breeders for the following spring. In some cases another special selection is made to secure birds possessing show room quality as well as laying ability, a combination not impossible and exceedingly desirable.

The question arises in either case as to a method for identifying individual birds. There are various ways in which this may be done, but perhaps the most satisfactory is the numbered legband. Plain aluminum bands serve very well for some purposes, but the colored aluminum-celluloid bands not only give the bird a number, but the various colors in which they come offer an opportunity to record the age of the fowl as well. For example, this year's pullets may be banded with red, next year's with blue and the third year's with green. The three colors will be sufficient, for it is seldom profitable to keep hens over three years.

Such markers may also be used to indicate breeding or matings, to differentiate one's hens from a neighbor's and to protect in a measure from chicken thieves. For the chicks various colors in celluloid spirals or rings are on the market and the larger sizes may be used for the hens. Their chief advantage is the low cost. Considering the small expense and effort involved the use of such markers is bound to be a profitable departure for either the backyard poultryman or the owner of a farm flock.

HONEY FOR BRITISH MARKET

In a recent article in an English paper by a British honey buyer we find:

"Dairymen, grocers, fruiterers, and in many cases druggists, find a ready sale for honey that is attractively packed and the quality of which is above suspicion. There is no more convenient package for export to the English market than cases, each containing two 60-pound tins, although I would prefer to purchase honey in 5 or 6 hundredweight tierces, being more conveniently handled where large quantities have to be packed. Honey for the English market must be perfectly clean in flavor, strong or herby flavors being disliked and therefore damaging to the trade. The favorite package for Cuban honey weighs about 5½ to 6 hundredweight (the English hundredweight is 112 pounds). Honey from Jamaica usually arrives in casks containing about 3 to 3½ hundredweight, while Chilian is usually packed in barrels of about 1½ hundredweight. Californias, New Zealand and Australian arrive in cases each containing two 60-pound tins.

"The tins must be clean and sufficiently strong to withstand rough usage. Cases should be made of thoroughly dried, sound timber, with the ends, tops and bottoms each made in one piece. There is no economy in using cheap cases, and to use dirty tins must result in great loss. The weight of the packages should be clearly marked outside each container where they are not uniform. Net, tare and gross weight should be shown, and where the name of the producer is also shown it gives the buyer greater confidence. Quantities of honey arriving in casks are in a very dirty condition, often containing thousands of dead bees and other objectionable rubbish. The English are very fastidious and will not purchase honey again, possibly for many years, if once they have been served with honey that has a nasty or unclean flavor. There is a great demand for best honey, and hundreds of orders are turned down through insufficient supplies of the quality we need.

"Most of the honey sent to England is consigned to merchants who usually place it in the hands of brokers for sale, but it would seem to us that it would pay better to make direct consignments to a firm which had the nceessary organization for selling, and machinery and appliances for packing."

CUBA SHIPS HONEY HEAVILY TO UNITED STATES

Cuba produces annually from 25,000 to 30,000 barrels of honey. Assuming that each barrel holds 50 gallons and that the honey weighs 12 pounds to the gallon the total outturn of the island is then 15 to 18 million pounds. This compares with an estimated production in the entire United States of around 250,000,000 pounds. Honey is gathered in Cuba from October to May, and colonies are found throughout the entire island.

As practically no honey is consumed locally Cuban beekeepers depend on the export trade for their market. Strained or extracted honey is the only kind produced. It is shipped largely in second hand barrels and shipments are usually of 50 barrels or more.

The United States has been a heavy purchaser of Cuban honey. During the year 1918 out of a total export of 22,556,923 pounds the United States took 12,420,423 pounds. The United Kingdom was second with over 8,000,000 pounds. The year following the total quantity brought into this country had dropped to 4,461,165 pounds out of a total of 10,340,552 pounds exported from Cuba.

POTATOES SOURCE OF FOOD

"Potatoes have become one of the important sources of food," stated Dean Hunt at the potato grower's conference held at the college of agriculture of the University of California. They have made possible a density of population, perhaps three times as great as was formerly possible. Indeed, since their introduction into Europe, the population has increased in number more than six times. In the five years preceding the war the average European yield per acre of bread grains, wheat and rye, was 815 pounds; of potatoes, 9,000 pounds. It is only during the last two centuries that potatoes have been grown extensively in Europe. Now, Europe produces ten times as many potatoes as North and South America combined. The potato with other American plants furnished the material foundation for the Renaissance. It has been one of the most important revolutionary forces in the world. It deserves your best endeavor."

The name of "spuds" or "Irish" potatoes is a brief remembrance of the days when the white potato practically saved the people of Ireland from starvation. Although the Irish people have a good reason to be fond of this potato its real origin goes back to America.

It is estimated that more than 14 per cent of all California farms grow potatoes. However, there has been a 16 per cent loss in production in the last ten years due to diseases found in the vegetable. Circulars 161 and 200 of the University of California agricultural experiment station describe the growing of potatoes.

LIQUID MANURE

Soak a sugar bag of fresh cow, pig or poultry manure for a week in 50 gallons of water. Use this at the rate of one part for three parts of fresh water. The same bag of manure will make another 50 gallons by using one part of the liquid to one part of fresh water. A third quantity of 50 gallons may then be prepared and used undiluted. Each 50 gallons should be a week old before using.

This form of liquid manure is all that is necessary for most growing crops used weekly. Apply four gallons to every 18 feet of a running row. No further stimulants need be added. —E. N. Ward, Botanic Gardnes, Sydney, Australia.

Holly Poultry Ranch
Hatching Capacity 200,000 Eggs
White Leghorn Chicks Only

Our customers contest which closed September 30, 1921, showed Farm No. 11 with 600 pullets hatched February, 1920, laid 217.09 eggs each, all in one flock. Can you beat this record?
We supply you stock bred for over 10 years for heavy production, incubated in the finest hatchery with perfect ventilation. Chicks delivered in perfect condition by our two specially constructed and ventilated auto delivery cars; capacity, 15,000 chicks at one load; or packed for express shipment by an expert who had 15 years in the Express service. Can any other Hatchery or Breeder offer you such service and quality chicks?
Call and see our new AIR WASHER SYSTEM, nothing like it anywhere. Perfect ventilation.
We are exclusive hatchers for spring of 1922, for F. R. Richardson, George J. Richardson, Charles G. Weaver, L. G. Hack, G. A. Saylor, C. W. Phelps, and George L. Miller; being the product of 25,000 selected breeding hens.
Agent for "Pride of Petaluma" Brooder Stoves. Our special Egg Turning Trays are now available for other hatcheries in quantity. Send for circulars.

BIG BLACKBERRIES

Huge blackberries growing to a length of 2½ inches and a breadth of 1½ inches have been discovered in Colombia, South America. Plants bearing clusters of these berries have been found by government agricultural explorers at an altitude of 10,000 feet. The plant is vinelike, half climbing, half self erect and in some cases grows to a height of 10 feet. Although only four degrees north of the equator, the altitude and the clouds drifting up the Magdalena Valley and depositing their moisture, make the climate cool and moist throughout the year; and for this reason it is thought the plants may be transplanted to the United States. The berry is not quite black in color but verges on a dark red. The taste is said to be surprisingly agreeable and pleasant.

SPROUTING POTATOES

Last year the island of Jersey exported 60,000 tons of potatoes and every one of the seed potatoes planted was sprouted in a standard size tray or shallow box, the growers using hundreds of thousands of these boxes.

The seed potatoes are harvested during the first half of July. They are carelessly gathered in the boxes or trays and left exposed for about a month. This fully ripens them and of course they turn green. At the end of a month they are stood in the boxes, sprouting end uppermost, and removed to a cellar or room wholly dark, temperature about 75 degrees Fahrenheit. In about two weeks sprouts are formed a quarter inch long, when the boxes are again moved to full light and remain there three weeks to harden and potatoes are then planted. Later plantings, for home consumption, are not so treated, and yield a heavier crop, but the Jerseyite is chiefly engaged in growing new potatoes for midwinter export trade.

Their secondary crop is tomatoes, following early potatoes.

Tire makers have been gathering a fund of information as to use and abuse of tires, not this year only, but for several years. "All statistics gathered tend to show a noticeable decrease in tire abuse. Troubles contended with in the past due to driving in car tracks, curb bumps, wheels out of alignment, neglected cuts, severe application of brakes, mis-application, etc., have been abated to no little extent, thus adding to tire mileage and the enjoyment of motoring, not to mention the decrease in operating costs of both passenger cars and commercial vehicles." All of which is satisfactory notwithstanding it is probably true that the experience which has brought us to this knowledge of how to protect our tires has been bought at high cost.

No farm is complete without a combined buzz saw and engine power outfit.

More Money Assured for Crops

Six Ways of Increasing Farm Profits---ALL EASY All Demonstrated---All Explained Here

If you could get $30 a ton for your alfalfa hay instead of $15 you would take it, wouldn't you?

If you could practically double the value of your barley, bean straw, vines, corn, oats, peas, milo, sudan—that would interest you, too?

That's what over ten thousand shrewd, investigating, practical farmers are doing, and we want to tell YOU how they did it.

You convert every vine, stalk, stem, leaf and kernel on your ranch into a marketable product.

It is an astonishing fact that great numbers of ranchers do not realize the feed and fertilizer value of the thousands of tons of coarse material that is wasted annually; that is improperly used or disregarded entirely.

You lose approximately 40 per cent of the possible total value of a grain crop by utilizing the grain alone. For example, 59 per cent of a corn crop is in the protein, carbohydrates, and fats of the kernels of corn—one per cent in the cob AND 40 PER CENT IN THE CORN STALKS AND HUSKS. You can save that 40 per cent and add 300 per cent bulk besides in corn, kafir, milo, and similar savings can be made on alfalfa, barley, cottonseed hulls, cowpeas, soy beans, etc., by cutting, mixing and grinding the grain and the fibre with a LETZ DIXIE MIXED FEED MAKER.

Feeders never feed grain only. Too few realize the difference between the value of an entire crop ground up into palatable feed that stock wants, and ordinary hay, straw and fodder fed as such with grain and mostly wasted.

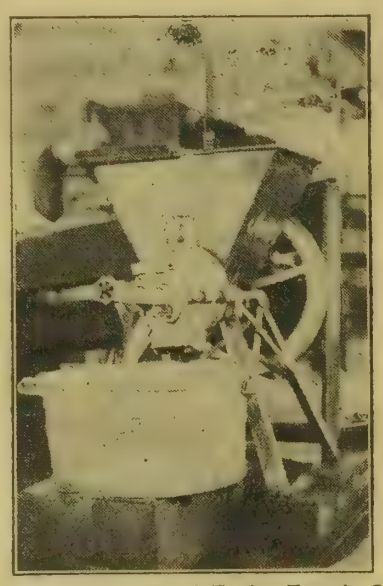
You can turn $12 a ton dark barley hay that has been wet into $20 or $25 a ton pulverized feed at a cost of not more than $2.50 per ton with a LETZ DIXIE FEED MAKER.

You can sell alfalfa hay that has been made into the finest kind of alfalfa meal with a LETZ DIXIE FEED MAKER for double what the alfalfa would bring as hay, especially if the hay has been rained on.

THE LETZ DIXIE will grind any hay into meal for less than you pay for baling.

Actual test records are numerous where feeding costs were reduced 50 per cent by the proper preparation of the feed given stock by proper cutting, grinding and mixing by one of the 11 sizes and 22 styles of LETZ feed cutters and grinders, there being a size and model to cut, grind and mix all the principal feed crops grown.

And the proper cutting and grinding of roughage increases its food value to such an extent that not nearly so much grain is required.



Interior view part of Taylor Tamale Co. factory where the LETZ successfully grinds cooked corn.

THE AVERAGE CALIFORNIA RANCH CAN MORE THAN PAY FOR A LETZ DIXIE FEED MAKER IN THE SAVING AND EFFICIENCY OF FEED CUT AND GROUND FOR THE WORK STOCK ALONE.

With a Letz Dixie you can have a mixed feed factory right on your ranch. You can manufacture mixed feed at $1.50 to $3.00 per ton, including labor, fuel, upkeep and depreciation. You no longer have to pay extra prices for ready mixed feed, manufacturer's profits and transportation costs—and you know what is going into your feed.

EVERY DAIRY SHOULD HAVE ONE

No dairy is complete without a LETZ DIXIE. Dairy cows do best on a bulky ration. Our book "Scientific Feeding" goes thoroughly into that, as well as explaining why various mixtures or feeds give best results for horses, mules, cows, hogs, sheep and chickens. Poultrymen who write us can obtain LETZ literature on feeding poultry written by men of national reputation. The books are sent free.

HOW TO ACCOMPLISH THESE RESULTS

But you cannot accomplish these savings and obtain these results with just any kind of a grinding machine. The LETZ FEED MAKERS have achieved the acknowledged supremacy in FEED MAKING MACHINERY BECAUSE OF CERTAIN CONSTRUCTION FEATURES NOT EQUALED OR APPROACHED BY ANY OTHER FEED GRINDING MACHINERY.

Among these exclusive features are the following:

LETZ mills are equipped with special plates that cut, grind and pulverize all in one operation. The pulverizing plates with thousands of keen cutting, scissor-like edges beat all other processes in fine cutting, light running, durability and capacity. Everything grindable is handled in ONE OPERATION whether wet, dry or oily without clogging. One set of LETZ plates are guaranteed to outwear three ordinary sets.

LETZ mills are made with only one shaft drive—heavy and unbreakable with plenty of bearings to insure strength.

Under the cutters the chopped hay passes through an adjustable screen. Roughage cannot reach the grinding plates until fine enough to pass through the screen.

From the cutting hopper the finely cut roughage is conveyed into the mixing hopper, where it is thoroughly mixed automatically, with whatever feed stuffs are in the hopper.

In the bottom of the mixing hopper a steel casting with heavy, sharp, curved knives crushes into fine meal, ear corn, kafir corn or large feed stuffs. The mixing hopper is provided with shaft preventing ear corn and similar material from bridging the hopper.

The roughage is thoroughly cut, recut and crushed and then forced fed into the grinding chamber where the especially designed grinding plates—an outstanding feature of all LETZ mills—cut, shear and pulverize the feed at a surprisingly large capacity and with comparatively small power.

Do You Want to Make More Money Out of Your Farming Operations?

LETZ PATENTED PLATES CUT AND SHEAR THE GRAIN AND ROUGHAGE LIKE A PAIR OF SCISSORS. They do not crush or mash. That is why they have exceptional capacity, long life, require less power and have the ability to handle material in any condition—wet, dry or oily—ABSOLUTELY WITHOUT CLOGGING.

Near Los Angeles a LETZ mill crushes WET COOKED CORN used in the preparation of one of California's finest products—Taylor's Tamales.

At Covina the San Gabriel Valley Milling Company uses a LETZ DIXIE to manufacture poultry and dairy feeds. Near Long Beach I. Stewart is converting $12 a ton barley hay that was rained on in shock into $20 to $22 a ton ground feed. Read letters from these satisfied users printed here.

We haven't begun to tell you all the features of this money making equipment here. More information is contained in our catalogue and our book "Scientific Feeding." We want every farmer, stockman, poultryman and orchard or grove owner to have this book. It is free. Send us your name and address on the blank below.

This is the LETZ DIXIE FEEDMAKER on the ranch of I. Stewart, where the mill is paying for itself by making fine feed out of barley hay. The ground feed is worth $8 to $10 more per ton.

SIX WAYS TO MAKE MORE MONEY

(1) Save all the crop—grain, stems, stalks, vines and all—they are valuable.
(2) Grind the feed instead of feeding it as raised. It increases the efficiency and value of it.
(3) Operate your own feed manufacturing plant—save hauling and manufacturer's profit.
(4) Farm for feed instead of farming with feed. Iowa's wealth is due largely to scientific feeding.
(5) You cut down the grain required by feeding a mixture that is prepared the way stock likes it.
(6) By grinding fertilizing material it becomes much more quickly available to plant growth, thereby increasing its value.

Letters from California LETZ Owners

Long Beach, Calif., Dec. 21, 1921.
Warr Implement Co.,
Los Angeles, Calif.
Gentlemen:
I bought a Letz Feed Grinder to grind barley hay that had been wet in shock and found that the mill is just what I want.
The mill cuts the straw and grinds the kernels, making fine feed out of it. The mill gave no trouble although the barley was damp and tough. The stock seems to relish the ground feed. Grinding increased the value of feed $8.00 to $10.00 per ton. Very truly yours,
(Signed) I. STEWART.

Covina, Cal.,

Warr Implement Company,
110 North Los Angeles St.,
Los Angeles, Calif.
Gentlemen:
We find our Letz No. Forty Mill very rapid and efficient and for the work we have to do better than any other we have tried.
Respectfully yours,
SAN GABRIEL VALLEY MILLING COMPANY,
(Signed) By L. L. Ratekin, Secy. M.

Poultry raisers should write for important LETZ literature on "Feeding for Earlier Poultry Profits." Citrus and orchard owners can save money on fertilizers by using a LETZ mill.
